As a result of an exhaustive study of its performance on other light-load interurban lines, the Gary Railways, Gary, Ind., recently installed a mercury arc rectifier in its new 500-kw. automatic substation at Woodville Junction, Ind. The machine was built by the American Brown Boveri Company, Camden, N. J.

The new substation represents an investment of approximately $33,000. It is the principal power distributing center on a 25-mile interurban line running between Gary and Valparaiso and replaces a portable substation that has been carrying the load on this line ever since the company's old rotary converter substation at Goodrum was burned last year. The rectifier is the first device of its kind ever to be employed on the Gary Railways and will supply energy to the Valparaiso division only, over which light-weight, one-man cars are operated on a two-hour headway.

On account of the relatively light load, it is expected that the mercury arc rectifier will bring about a considerable improvement in operating conditions and will tend to cut down operating and maintenance costs.

Record Made by Oldest Roller Bearing Car

Car No. 201 of the Peoples Railway, Dayton, Ohio, equipped with Rollway journal bearings, was placed in service March 31, 1912, and made 90,000 miles during the first two years without any attention. These bearings were replaced in November, 1914, with bearings of an improved design, and these have been in operation ever since. The operating men like this car and it is reported as being in almost continuous service. It is believed that this is the oldest roller-bearing rail car that is still in regular operation.

Replacement Business in Tires Good

Solicitation of spring dating orders from tire dealers, which started on Nov. 15, is expected to stimulate manufacturing schedules during the normally dull winter months. During the past month production of tires has been gradually diminishing, owing to a slowing up in the retail field, as well as in orders from the automobile, bus and truck manufacturers for original equipment. Dealers have continued to place good sized orders for bus tires, but the bus manufacturers have not been buying as heavily as formerly.

More talk is heard in the tire industry about the so-called evil of selling tires to bus operators on a mileage basis, but those opposed to it seem to be making little progress toward correcting the practice. Some manufacturers are even guaranteeing their tires to give as high as 30,000 to 40,000 miles service. Some years ago tires sold to the general public had a mileage guarantee, but the policy was abandoned because of its impracticability and patent injustice to the manufacturer and dealer. Many authorities say the same situation seems to have arisen in the bus tire field.

Radical changes in the future manufacturing process of tires and inner tubes are seen in a new development in compounding, milling and vulcanizing rubber. Engineers are said to have demonstrated that tubes made by the process wear longer than others, although less crude rubber is used in their composition. As yet no practical way has been found for adapting the process to the manufacture of casings, but experiments are being continued along this line.

Graham Brothers' Nine Months Record

Sales of Graham Brothers' motor coaches and trucks during the first nine months of this year were 78.4 per cent greater than the record for the first nine months of last year. Total sales for the first nine months were 29,336 units.

From the very beginning, according to a statement by the manufacturer, sales of Graham Brothers' truck and motor coaches have shown steady increases. In a statement made by them Graham Brothers say a total of 1,086 units in 1921 marked their initial sale. Sales in 1922 of 3,401 units was an increase of 213 per cent over the first year, while a total of 6,971 units in 1923 was an increase of 105 per cent over the previous year. Sales in 1924 of 10,791 showed another gain of 55 per cent over the year before, while in 1925 this record was again shattered with a total sale of 24,056 units, an increase of 123 per cent over 1924.

A.C.F. Small Bus Coming

With the number of *News Regarding Transportation* for November, the American Car & Foundry Company started another valuable service and from time to time hereafter will discuss some particular phase of transportation which is vital to modern economic life. In addition, a summary of the most important railway developments will be presented in clear, understandable manner.

One of the things the company does is to explain why the company entered the motor field. It says that the first practical result from the formation of the American Car & Foundry Motors Company was the winning of a contract to furnish 50 buses for the service operated by the city of Detroit. The company's program now contemplates the production of a small bus such as an eighteen-passenger parlor car or 21-passenger street car, and also a line of four or five truck models. Details of these are now being worked out at the company's Detroit plant.

It is explained that the first step taken by the company toward establishing the new bus activity was to look about for an existing motor bus and satisfactory engine. It found the bus in the Fageol safety coach and discovered also that one of the principal factors in Fageol efficiency was the engine—the Hall-Scott motor. So these two companies were acquired by the American Car & Foundry Company through the formation of the American Car & Foundry Motors Company, the stock of which was exchanged for that of Fageol and of Hall-Scott Motors. During these preliminary negotiations, it became apparent that the J. G. Brill Company, Philadelphia, was also in search of an efficient motor bus and engine which it could supply to its customers. The American Car & Foundry Company and the J. G. Brill

Digitized by Google

Company were in no sense competitors, but it chanced that about the same time they were both seeking the opportunity to furnish the same sort of service to their respective patrons. So it was that they joined forces, and the combination was effected by the formation of the Brill Corporation, whose stock was issued in exchange for that of the American Car & Foundry Motors Company and the J. G. Brill Company, the control of the Brill Corporation stock resting with the American Car & Foundry Company.

Rolling Stock

Pennsylvania Railroad, Philadelphia, Pa., is reported to be contemplating the purchase of 60 multiple-unit cars, presumably for service in connection with the Philadelphia - West Chester - Wilmington electrification upon which the company is now engaged.

Jacksonville Traction Company, Jacksonville, Fla., contemplates, as part of its plan for extending and improving that property under a new franchise now under negotiation, purchasing fifteen new double-truck cars at an estimated cost of $225,000 and seven buses at a probable cost of $46,000.

Lincoln Traction Company, Lincoln, Neb., has purchased twelve 25-passenger Mack coaches and two 21-passenger Studebaker coaches. The two Studebakers and six of the Macks have already been received and operation has been started on the South Fourteenth Street and penitentiary and the agricultural college and University Place lines.

Portland Electric Power Company, Portland, Ore., will purchase eight buses before Feb. 15 for use on the Ross Island bridge line, now almost completed. The new service will cover southeastern Portland, a district heretofore not adequately provided with public transportation.

Youngstown Municipal Railway, Youngstown, Ohio, will negotiate for the immediate purchase of five new buses. Traction Commissioner Engle stated recently that peak service required 50 buses, that it controlled 51 vehicles, but that at present it was without any excess capacity in vehicles.

Metal, Coal and Material Prices

Metals—New York	Nov. 23, 1926
Copper, electrolytic, cents per lb.	13.475
Copper wire, cents per lb.	16.00
Lead, cents per lb.	8.00
Zinc, cents per lb.	7.52
Tin, Straits, cents per lb.	72.375
Bituminous coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$8.125
Somerset mine run, Boston, net tons	2.625
Pittsburgh mine run, Pittsburgh, net tons	2.425
Franklin, Ill., screenings, Chicago, net tons	1.875
Central, Ill., screenings, Chicago, net tons	1.525
Kansas screenings, Kansas City, net tons	2.35
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$6.00
Weatherproof wire base, N.Y., cents per lb.	17.50
Cement, Chicago net prices, without bags	2.10
Linseed oil (5-bbl. lots), N. Y., cents per lb.	11.2
White lead in oil (100-lb. keg), N. Y., cents per lb.	14.75
Turpentine (bbl. lots), N. Y., per gal.	$0.89

Municipal Railway, San Francisco, Cal., contemplates purchasing fifteen more cars. Track of the matter was for a time almost lost in the byways of officialdom. Several weeks ago the necessary appropriation was held up by Chairman James B. McSheehy of the finance body due to a bonus clause in the contracts, but it has since been decided to let the contracts and permit cars to be built as soon as possible. City Attorney John J. O'Toole advised the committee that new contracts would have to be awarded if the offending clause was stricken out. Moreover, the finance committee of the Board of Supervisors has approved an appropriation of $100,000 to purchase motors for the new rolling stock.

Trade Notes

American Brown Boveri Electric Corporation, New York, N. Y., has announced that W. R. Foster, formerly sales engineer with the Bridgeport Brass Company, Bridgeport, Conn., has joined its staff to engage in sales promotion activities. He will be located at 165 Broadway, New York City. He is a graduate of Columbia University in engineering.

Ohio Brass Company, Mansfield, Ohio, has established new quarters for its San Francisco and Los Angeles branch offices. The new address of the San Francisco office is Room 531-532-533 Matson Building, 215 Market Street, telephone Davenport 9383. The Los Angeles office location is Room 508 Subway Terminal Building, 417 South Hill Street, telephone Mutual 3506. In both of these cities the company will continue to carry ample stocks of its various products for the convenience of the Western trade.

George T. Marchmont has been appointed Southern district manager of the Graybar Electric Company, New York, N. Y. Mr. Marchmont's headquarters will be at Atlanta, Ga. Until the announcement of his present appointment was made he was manager of the branch office at Richmond, Va. Mr. Marchmont succeeds Howard Hall, who has been promoted to the staff of Frank A. Ketcham, executive vice-president of the company, with headquarters in New York.

New Advertising Literature

American Brown Boveri Electric Corporation, New York, N. Y., has issued descriptive circular No. 301 on mercury arc power rectifiers for manual or automatic control.

Cummings Car & Coach Company, Chicago, Ill., has published a booklet which contains photographs and principal specifications of some of the recent modern rolling stock built by the company for city, suburban and interurban service.

Economy Electric Devices Company, Chicago, Ill., has issued a reprint from the Sept. 18, 1926, issue of the ELECTRIC RAILWAY JOURNAL entitled "Many Variables Affect Energy Consumption by Electric Railways," by J. T. Lake. The company has also reprinted its "ad" from the ELECTRIC RAILWAY JOURNAL of Sept. 25, 1926, called "Cleveland Saves Power."

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has published a rearranged and revised circular on supervisory control and its equipment. This publication first deals with a general discussion of supervisory control beginning at the first successful installation of the property of the Cleveland Railway. The publication then takes up synchronous visual type of equipment, the code visual type and audible type and finishes with a discussion of the supervisory control protective equipment. Illustrations assist in clarifying the discussion.

Interflash Signal Corporation, New York, N. Y., has prepared specifications and drawings as well as descriptive matter showing Interflash traffic signals and signs for use at highway intersections, railway crossings and at other points where traffic warning or direction is essential. These signals comply with the standards adopted by the American Association of State Highway Officials and approved for use on all federal aid highways by the United States Department of Public Roads.

Botfield Refractories Company, Philadelphia, Pa., recently appointed the following concerns as distributors for its product, adamant fire brick cement: The Curtis Supply Company, Inc., Washington Street at Perry, Buffalo, N. Y.; The Waldredh Supply Company. 707-711 Cherry Street, Des Moines, Iowa; South Side Foundry & Machine Works, Charleston, W. Va., and the Empire Machinery & Supply Corporation, 409-411 Water Street, Norfolk, Va.

Timken Roller Bearing Company, Canton, Ohio, has issued a two-page folder descriptive of the positive roll alignment which is a late advance in the design of roller bearings. In this design the rib of the cone is undercut so that the large end of each roller makes contact at separate areas. The rollers are thus kept at right angles to the shoulder of the cone.

Reo Motor Car Company, Lansing, Mich., has issued a circular letter giving complete operating costs on a fleet of ten Reo model W pay-enter buses in service by the Southwest Missouri Railroad Company in Joplin, Mo., over a total of 417,214 miles in the course of one year's operation. Detailed figures on the various items of operating expense are included. Cost per mile for operation is stated by the Reo company to be less than 8 cents per mile.

Bethlehem Steel Company, Bethlehem, Pa., has published a booklet in which are set forth the several advantages of Bethlehem stainless steel and stainless iron. It is pointed out that the total yearly loss of metal due to corrosion is more than 25 per cent of the new metal produced in the world each year, and the increased use of stainless steel and stainless iron would materially reduce this deterioration and loss. Various technical data are contained in the booklet to show the physical characteristics of these two products.

Plan Early for the Cleveland Convention

EACH year the advantages of fixing the location for the annual convention early in order that adequate plans can be made have been apparent to the industry. Each year, however, matters have been held back by necessary negotiations, and the time available for staging so extensive a show has always been far too short.

Thus the industry will welcome the action of the executive committee in deciding at this early date to go back to Cleveland. This gives to manufacturers and other exhibitors an opportunity such as has seldom been available before. There is now ample time to lay out plans far in advance and to undertake developments to be introduced at the convention.

Some manufacturers have questioned the advisability of the heavy expense incurred in exhibiting standard apparatus with which most of the industry is already familiar. In some cases such a question seems to be justified, although there are always younger men coming up in the operating companies to whom even such an exhibit is educational and valuable. But the fundamental object of an exhibit is to show new devices and developments. The introduction of anything new is always attended with a certain resistance on the part of conservative operators. A convention exhibit gives such men an opportunity of seeing first hand the new things that have been brought out. If the exhibit shows the apparatus in operation, so much the better.

Today there is a rare opportunity offered to electric railway manufacturers. Railway men are in search of new developments and improvements. Competition of other forms of transportation has brought about a keen demand for any product that will help to improve the character of railway service or to reduce the costs of operation. For that reason the traditional conservatism and resistance to new things have been replaced by an awakened interest.

In no class of equipment is this interest stronger than in the electric railway car itself. The industry is alert to the advantages of car improvement. New and better cars have proved to be an effective means of winning public friendship, employee co-operation, increased patronage and reducing operating costs. The industry is looking for such cars. It is ready to investigate any practical improvements which the builders have to offer.

But in this opportunity there is also a responsibility for the car builders. The time has come for them definitely to take the initiative. It will no longer suffice merely to stand in readiness to work out the customer's ideas. The price of recognized leadership is initiative and courage. The idea that railways will not buy cars worked out in detail and developed by the builder as a complete product is being rapidly dissipated. The builder who maintains the status of a contractor and refuses to take the lead in stimulating design improvement may expect to lag behind in the march of progress. During the last year at least one car order was placed as the result of a comparison of sample cars submitted by several builders to demonstrate what they could offer in the way of improvement. The car exhibit at the next Cleveland convention will be a striking illustration of what the various builders have been doing during the year. Many car orders may be expected to be placed on the basis of what is shown there. Now is the time to work out new ideas. The Cleveland convention will be the place to show them. The nature of that exhibit will clearly indicate whether the industry has been moving forward or standing still during the year. Now is the time to plan for the next convention.

Valuable Ideas Developed Through Trainmen's Co-operation

SUCCESSFUL organizations fall into two classes, those in which one master mind dominates through will power and an amazing grasp of detail and those in which the management represents the collective brains of the personnel. The one-man organization corresponds to that type of government called a benevolent despotism. It is never attained; it just happens. When the despot dies, it is found that no one was trained to fill his shoes. The collective organization, on the contrary, is the fruit of careful upbuilding. It is not that kind of organization defined as "but the lengthened shadow of a man."

So much has been heard about one-man organizations that it is a relief to turn to one that has achieved success through the policy of bringing out every worker's individuality to the limit—where the ideal is to operate with the collective intelligence of all the staff instead of only a few at the top. This truly co-operative management is being sought by the Pittsburgh Railways by various means, of which the most important is probably the monthly meeting of its trainmen with the operating officials and department heads.

Staff meetings of foremen and department chiefs are not new. They have done much good. Their limitations are twofold, however: First, a small group of men soon runs out of live subjects; second, they do not touch bottom by bringing in the rank and file—the men on the platform who are in the first line of contact with the public. In the case of Pittsburgh, the company took the unusual step last February of securing this rank and file co-operation directly through the union representatives at the various car stations, and it has worked.

The union's spokesmen have found in this co-operation an enlarged importance for themselves and an enhanced appreciation of the part that the united intelligence of the trainmen can play in the operation of the property. As the recording secretary said at the

Digitized by Google

October meeting: "These sessions dispose of more troubles in a month than a business agent could settle in a year through the old channels."

The *modus operandi* is simplicity itself. Through their agents the men submit any suggestions which they believe will produce better conditions for themselves and for the riding public. These suggestions are assigned to the appropriate department head or joint committees, and at the following monthly meeting they submit their findings.

The October meeting, for example, disclosed that quite a number of suggestions made a month or two before were already in effect, and that others depended in a measure on the co-operation of municipal interests. The many complaints on hazards caused by parking, narrow streets and the like led to the formation of a committee of trainmen which will present traffic conditions as the motorman sees them to the Better Traffic Committee of Pittsburgh. The vivid interest displayed in safety questions led to the sending of a representative from each carhouse to a national safety convention.

That the trainmen also think of ride-selling and finance is shown by the suggestions concerning transfers, passes, splashing switches, hard-riding cars, additional shelters, better-located stops and so on. Unquestionably, the monthly statements of the company earnings, mileage output, usefulness in transportation and current state of the pocketbook have helped to increase this interest. These figures, read and elucidated by Vice-President Fitzgerald, go a long way toward making the men feel that they have a real stake in the property. The assumption that men do understand helps them to appreciate their work beyond the mere manipulation of the controller and ringing of the register.

A Concrete Example of Railway Starvation

WHILE much has been said and written regarding the ill effects of competition in transportation, it is usually in generalities. Seldom has there been a concrete case where the situation is brought out so clearly as in Canton, Ohio. The facts were presented to the municipal authorities of that city by the Beeler Organization in a report which is abstracted in this issue. In this report it is shown that the street railway system, which had a franchise to furnish transportation in the city, and which was required to furnish its service subject to stringent regulations of the City Council, had been given no protection against individuals who wanted to exploit the railway by providing competing bus service. It was of no avail that the company was willing to provide, and did provide, supplementary bus service where the rail service was deemed inadequate. The competing buses have been allowed to encroach in all parts of the city until they carry about 40 per cent of the riders.

As a result of the failure of the city to live up to its bargain, it is faced with complete failure of the railway company. For the last several years operating expenses have not been met. The service has deteriorated, the cars and the tracks have been allowed to fall into disrepair, principally because the owners of the system have no assurance whatever that further investment will be protected any better than in the past. If, as the report shows, the management of the property has failed to be aggressive, such a condition can be understood.

That complete withdrawal of rail service and the substitution of buses would be uneconomical is shown in the report. It is estimated that the operating expenses of an all-bus system would be $116,505 more each year than for the co-ordinated car and bus system which the company can give if permitted to do so. What the total cost of service would be in the two cases cannot be determined with accuracy, as it involves a valuation of the railway, for which figures are not available. It is estimated, however, that the city will save between $1,500,000 and $2,000,000 in the life of a 25-year franchise if the co-ordinated system is adopted, besides having superior service the while.

City and company representatives will do well to ponder this report. There are many cities of moderate size where conditions are not dissimilar to those in Canton, and where threats have been made against the existing transportation companies. In not a few competition has been allowed to flourish, with the inevitable decline in quality of service. Undoubtedly the consequences will be similar to those reached in Canton. By allowing the established system to develop, the transportation rendered will be superior to that where the starvation process ends in abandonment of service by the carrier best fitted to furnish it to the community.

Bus Membership Discretion May Well Rest in Executive Committee

A COMMITTEE has been appointed this year by President Sawyer to study the American Electric Railway Association constitution with a view to suggesting any changes which in the light of developments in the industry may seem desirable. The question of membership of independent bus operating companies is one of the specific matters under consideration.

At the present time the constitution permits membership of bus manufacturers but limits bus operating membership to subsidiaries of railway or railroad companies. Two years ago a similar question of broadening the membership requirements and changing the name of the association was under consideration, but was rejected. At that time the industry was hardly ready for the change. This was even more true when the subject was considered on the floor of the convention in 1921. Today, however, the number of electric railways which are operating buses is larger than those which do not do so, and the number of such buses and bus lines is constantly growing. In addition the situation has become complicated by the admission of bus manufacturers to membership, some of whom are bus operators as well as manufacturers. As the result of ownership of operating company financial paper, a number of those manufacturers who are not operators directly are indirectly, at least, very much involved in the operating side of the industry.

Under the present constitutional provisions membership is open to bus operating subsidiaries of steam railroads as well as of electric railways. Although such a situation would be deplorable and would not be in the best interest of sound transportation development, there are indications that competition may in some instances develop between such steam subsidiaries and electric railway bus operations on a scale which would prove every bit as destructive as has any

Digitized by Google

of that independent competition which grew up during the absence of regulation. The present constitution also permits retention of membership by bus operators who were at one time electric railway members, but who have since entirely substituted buses for their rail lines.

A peculiar situation exists in the case of the Fifth Avenue Coach Company in New York, which is not at present eligible to membership as an operating organization. Before this property was sold to its present owners by the Interborough Rapid Transit Company it would have been eligible to membership under the present constitution. Such a membership could probably have been retained even after the bus line was sold. Now, however, this company, not eligible to membership, has reversed the usual situation by entering into a contract to buy an actively operating electric railway member company; i.e., the New York Railways. In this case the bus company, instead of being the subsidiary, would become the parent company. Under the present wording of the constitution there is a question as to whether the parent company would be eligible to membership despite the fact that its subsidiary is an active member.

All this is merely by way of showing the need for careful study of the question of bus membership in the association. The present committee's work on the constitution is intended to suggest enabling changes. These would be so worded as to put into the hands of the executive committee the power to decide whether an independent bus applicant should or should not be admitted, instead of retaining a rigid constitutional bar to such consideration by the executive committee. It is obvious that the transportation industry is going through a critical period of readjustment. For that reason it seems wise to provide a certain degree of flexibility regarding membership requirements in the constitution, placing discretionary power in the hands of the executive committee.

It seems only reasonable, from the standpoint of fostering sound development of local transportation and of bringing about constructive co-operation, that unfortunate situations of the past and prejudices growing out of them be not permitted to stand in the way of expanding the association's activity in keeping with the needs of the times.

New York's Comptroller Insists Subway Policy Be Stated

COMPTROLLER BERRY of New York City is a recalcitrant, not just for the sake of recalcitrancy but to a good end. He can't quite see where New York is headed on its present subway policy—if its attitude may be so dignified—and he wants to know from his colleagues in the city administration just what it is all about.

Tammany, of course, slid Mr. Walker into the office of Mayor after it had pinned the responsibility for delay in subway relief measures upon former Mayor Hylan. Mr. Berry, who went into office at the same time as did Mr. Walker, is an independent—extremely independent. He can't see any great difference between the Hylan and the Walker subway policies except that Hylan bragged about his inaction while Walker, who welcomes queens and prizefighters felicitously and passes over to them the keys of the city, has done nothing more about subways than to promise to confide in the public at some time later on.

On the other hand Mr. Berry has sat down with the problem and determined that the system now under construction in New York may cost $1,000,000,000 instead of $500,000,000 or $600,000,000. That sum may be a song or even a waltz to Walker, but it is something entirely different to Mr. Berry. And he wants to know. He insists upon knowing. In the eyes of Mayor Walker Mr. Berry may appear as a replica of the Bull of Bashan, but to the public of New York City he may prove their subway savior. Among other things, Mr. Berry wants to know: How is the great undertaking to be paid for? Is the plan adopted "the best for the entire city?" How is the system to be operated? These are questions that cannot be answered in strains of a waltz step, expertly negotiated, or by an aphorism. Mr. Berry realizes it, but Mayor Walker has given no evidence that he does. Shadow boxing doesn't qualify men to tackle problems like this one. There seems little need to express the wish that Mr. Berry will persist in his pursuit that something tangible be done.

Federal Judges' Salary Bill Deserves Support of the Industry

PRESENT salaries of district judges, $7,500, and of circuit judges, $8,500, are so inadequate, particularly in the larger cities, that there is general dissatisfaction among the incumbents, not to mention a feeling of injustice. A number of the judges have resigned, and not a few are merely holding on until they determine whether the situation will be bettered.

In order to relieve the situation, a bill increasing the salaries of district judges to $10,000 and of circuit judges to $12,500, with corresponding increases for other federal judges, was introduced in and has passed the Senate. It is definitely set for a vote in the House of Representatives on Dec. 9. The American Engineering Council and its constituent engineering societies have been vigorously supporting the bill in both houses of Congress, and have been represented before a number of congressional committee meetings. The passage of the bill deeply concerns not only the welfare of the country in general, but it is of special import to those industries, such as the electric railways, which frequently have technical problems like valuations and franchise matters before the federal courts. Much unnecessary litigation has resulted from failure of the courts to interpret correctly matters of this sort, and any lowering of the standard of the judiciary will make the danger of this still greater.

As to the justice of the proposal for increasing salaries there can be no argument. It is grossly unfair to have invited capable lawyers to give up profitable practice and take appointments to one or another of the federal courts in days past, when the salary afforded a comfortable and dignified living, and then, when the cost of living goes up, not to increase the salaries at least proportionately. It is poor business, because the judges cannot do their best work when they have difficulty in making both ends meet and maintain the standard which the dignity of the position demands.

The bill should be passed if the quality of the federal judiciary is to be maintained.

Well-Equipped Garage

Added to the Twin City Rapid Transit System

New Structure at Minneapolis to House 100 Buses Is an Operating Unit as Well as a Repair Shop and Storage Room—Particular Attention Has Been Given to Heating and Ventilating—New Machine Tool Equipment Has Been Installed—Building Was Designed and Constructed by the Austin Company of Cleveland, Ohio

BUILT new from the ground up along modern lines is the new garage for housing and maintaining bus equipment of the Twin City Rapid Transit Company of Minneapolis and St. Paul, Minn. The building, constructed of steel and concrete, is finished in a pleasing manner with pressed brick facing and stone trim. It has a depth of 300 ft. and a total width of street frontage of 135 ft., being sufficient in size to house 100 buses and still leave room for the ordinary servicing and repair of the equipment.

Besides building a centralized bus repair shop it was the intention to create an operating division for the bus men comparable with the six well-equipped car stations which are located in the Twin Cities. Included are a locker room, bus men's quarters, cashier booth, office and similar facilities that are necessary to an operating station.

In this construction, and the accompanying establishment of bus service on the same high plane on which electric cars have been operated for years in the Twin Cities, is seen one of the important steps that generally mark the operation of such vehicles by established carriers rather than independents. The bus operations recently taken over by the electric railway interests comprise virtually all the intercity service between St. Paul and Minneapolis. For about ten years this service had been operated by independents. In addition several local lines are being established in the city of Minneapolis.

The garage is located but a short distance from the downtown center of Minneapolis, yet on a street so situated that it will not likely be congested with automobile or trucking traffic. The property on which the building is located is also adjacent to a switching spur, so that supplies in carload lots can be received. After the company officials decided upon the general location, type and general specifications of the bus station, the Austin Company of Cleveland, Ohio, was chosen to plan the detailed layout and construct the building.

Height clearances of 15 ft. are maintained over the entire operating floor. The main portion of the building, having a width of 100 ft., is spanned with steel roof trusses, leaving the area below free of columns. To one side of the building is a 35-ft. bay that is used for shops and storage, except at one end, which is partitioned off for a store room, office, bus men's quarters, etc.

The roof deck consists of 2-in. x 6-in. yellow pine sheathing over purlins with a four-ply built up tar and gravel roof. The floor consists of a 6-in. reinforced concrete slab trowel finished, the surface of which has been treated with three coats of Lapidolith hardener.

Because of the severe cold of Minnesota winters, particular attention was given to heating and ventilat-

Below the Main Garage Floor Is the Boiler Room. Two Low-Pressure Steam Boilers in the Center Are for Heating the Building

The boiler partially showing at the right supplies hot water to the building and for washing automobiles and buses. All are oil fired. At the left is the oil reclaiming equipment with a De Laval separator in front and the dirty oil and reclaimed oil storage tanks behind and against the roof.

and dirt that find their way into the central duct.

Repair pits are separately ventilated with a No. 2 Sirocco utility fan. Arrangements for heating and supplying fresh air to the repair pits have also been made.

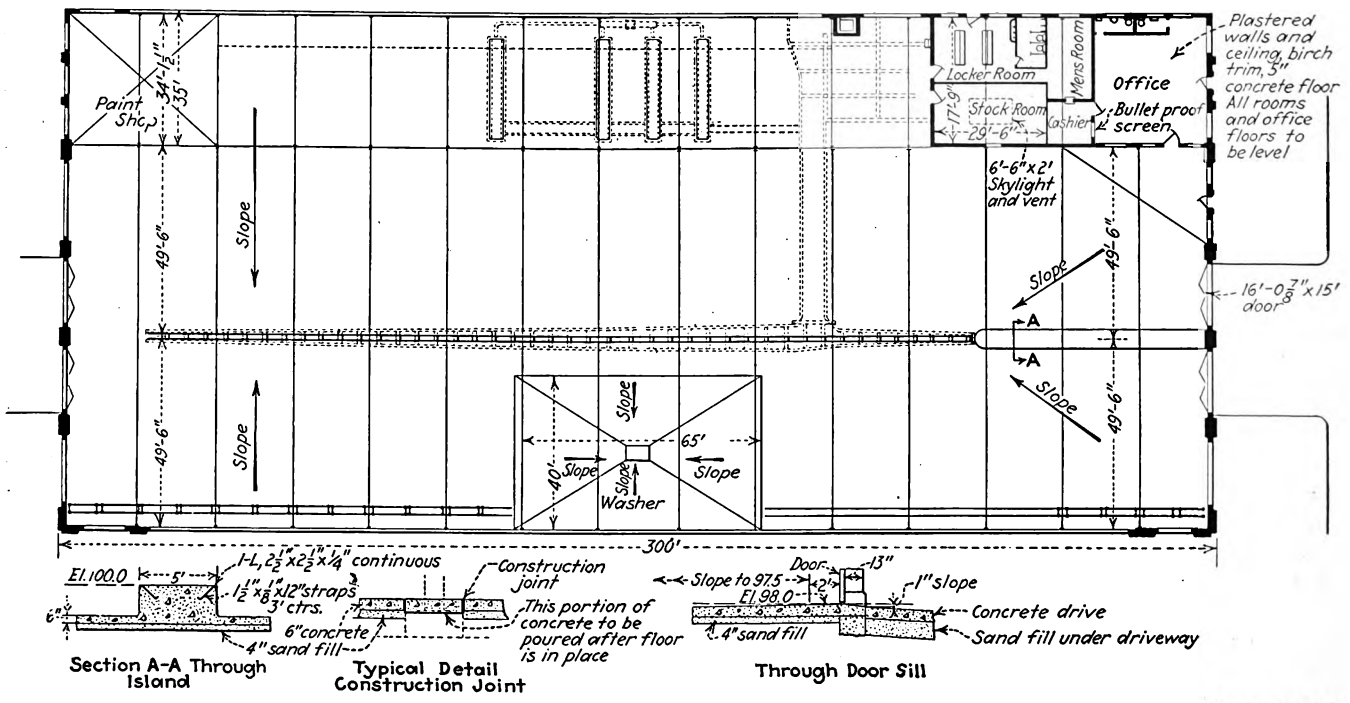
Two low-pressure boilers, fired by fuel oil, are located in the basement and supply heat for the building. In the garage section four Venturafin unit heaters warm the air in the room through recirculating boxes heated by steam. With this system the air is heated by a recirculating process, drawing a variable amount of fresh air from the outside as desired. Heating capacity is available to maintain the interior of the garage at 45 deg. F. by recirculation when the outside temperature is 25 deg. below zero.

Inclosed rooms, such as the office, bus men's room, etc., are heated by direct steam radiation and are designed for maintaining 65 deg. under the above minimum outside temperature. A third boiler, which is also fired by oil, is arranged to supply hot water to the building and also for washing the buses.

ing. The floor has a slope from each side of the building toward the center of 6 in. Through the center of the building runs a 6-ft. x 6-ft. duct for ventilation and drainage. This is covered over the top with subway gratings. This duct leads to a foul air chamber near the boiler room, in which are installed two 48-in. Ventura type disk ventilating fans, each having a free air delivery of 16,000 cu.ft. per minute. Foul air and exhaust gases are thus drawn off the floor and to the outside through this duct, as are also waste water, dust

The entire heating plant is placed below the level of the floor, as shown in the partial side elevation of the building, thus making possible gravity return for the condensed water. Fuel oil for furnace use is received in carload lots. It is pumped from the tank cars to a 17,000-gal. tank buried below the floor of the building near the boiler room.

A steam pipe is run inside of the fuel oil pipe for heating the oil in cold weather and for supplying steam necessary in unloading the fuel oil tank cars in winter.



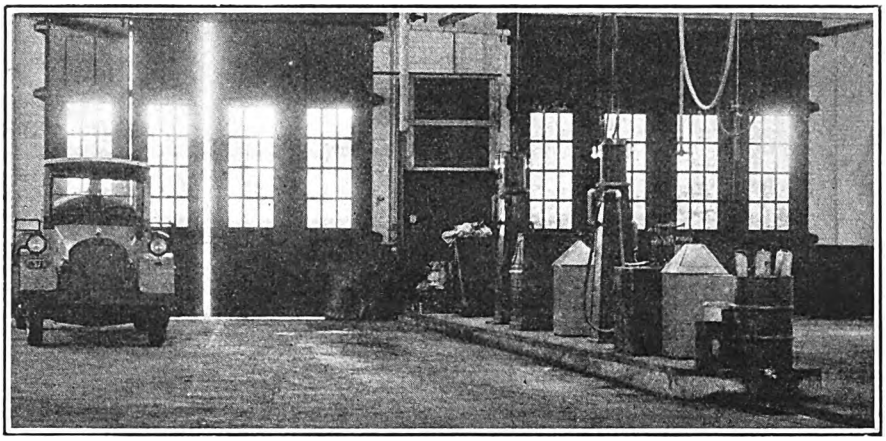
Floor Plan of the Twin City Rapid Transit Company's New Garage in Minneapolis. A Space 100 Ft. in Width by 300 Ft. in Length Is Clear of Supporting Columns. In Addition a 35-Ft. Wing the Full Length of the Building Is Used for Storage and Repairs

Digitized by Google

The entire building is protected against fire by a standard sprinkler installation, the construction of which can be noted in a number of the interior views.

Illumination is provided by 200-watt lamps mounted in white enameled reflectors suspended from the roof at the level of the bottom chords of the roof trusses. These units are spaced 20 ft. apart one way by 25 ft. the other.

Space is provided for washing four buses at one time on the area of the main floor designed as a wash rack. The concrete floor in this section has a slope of 8 in. from all sides toward the center drain. A U. S. four-gun washer equipment has been installed.



At the Rear of the Main Room of the Twin City Rapid Transit Garage Is a Raised Platform on Which Are Mounted Two Gasoline Filling Pumps, Engine Oil Containers, Waste Cans, etc.

The buses leave the garage through the rear doorway, receiving a supply of gas and oil as they pass by this station

A portion of the garage building, 40 ft. x 35 ft., as shown in one of the illustrations, is closed off by heavy canvas drop curtains to form a paint shop. In this room steam radiators are installed for additional heat in winter and a ventilating fan mounted in one of the sash carries off the paint fumes.

Gasoline, purchased in carload lots, is stored in two 17,000-gal. tanks, which are buried 4 ft. underground immediately adjacent to the railroad siding. Both the siding and tanks are considerably below the floor level of the garage and the gasoline, after being unloaded into the storage tanks, either by gravity or by pumping from the dome of the tank car, is again pumped to the garage floor as actually used. The pump house for handling gasoline and fuel oil is located adjacent to the railroad spur and contains two gasoline and one fuel oil pumps.

Inside the main garage building is a raised concrete platform 8 in. high, 5 ft. wide and 60 ft. long, on which are mounted two gasoline-filling units, lubricating oil containers and radiator water fillers. The gasoline fillers have spring valves, which, when held against a spring button, automatically start up the gasoline pumps, allowing the bus tanks to be filled. When the handle is turned off the valve is closed and the pump is shut down, permitting the gasoline in the filling hose and pipe to run back into the main storage tank. This latter was a requirement on the part of the city of Minneapolis.

Arrangements have been made for reclaiming lubricating oil used in engine crankcases by means of a DeLaval oil reclaiming set, illustrated in one of the views, which is installed in the boiler room. When the buses are drained the dirty oil is run into one of the three compartments in the dirty oil storage tank, depending on the kind of oil that had been supplied to the bus. The oil is then drawn by a pump through the reclaiming

Machine Shop Well Equipped with Individual Drive Tools

1 Manley hydraulic press.
1 No. 901 Manley tire changer.
1 Manley combination brake relining machine.
1 36-in. Crescent motor-driven band saw.
1 No. 388-C 15-in. x 6-ft. bed South Bend engine lathe.
1 No. 398 24-in. x 8-ft. bed South Bend quick change gear gap engine lathe.
1 10-in. Stecher high-speed drilling machine.
1 6 x 6 Pearless Universal sawing machine.
1 Black & Decker electric valve refacer.
1 3-hp. Black & Decker electric grinder, equipped with two 12 x 12-in. grinding wheels.
1 No. 2-A, 4,000-lb. Detroit type H electric hoist, 3½-hp. motor, 15-ft. lift.
1 21-in. Cincinnati Bickford upright drilling machine.
1 Model 55 constant potential battery charger, 100 amp., 7.5 volts, manufactured by Weidenhoff Company, with test bench, lathe with bench attachments; armature Test-O-Meter, undercutter with lathe attachments; Bull Dog magnet recharger.
1 5½ x 5-in. water-cooled air compressor.
1 U. S. Model AW-4 four-gun electric car washer.
1 Grayco high-pressure (4,000 lb.) grease outfit.
1 Tokehim portable pneumatic oil transfer (12-gal. tank) with pump and hose (for changing oil at grease pits).
1 Boe model two-barrel grease pump, with hose and barrel truck.
3 Boe model 80 lubricator units, each with 60-gal. tank, drip accumulator.
1 Barrel truck and hand barrel pump with hose.
1 Toledo trip scale.
5 Super-Weld portable benches.
1 International time recorder (daily dial).

set, whence it is pumped into one of three 100-gal. storage tanks fastened to the ceiling of the boiler room. The reclaimed oil is then pumped directly to a filling hose located over the lubricating oil storage tank on the platform in the bus garage. In this way oil is drained from the buses, reclaimed and put back into lubricating oil tanks without handling in buckets or drums.

It is planned to handle all inspection and maintenance work in the machine shop section. This shop is well provided with individual drive machine tools, as shown in an accompanying view and the list of equipment tabulated elsewhere.

It is thus seen that the garage is well equipped not only to handle the buses of the company from an operating standpoint but to maintain them in excellent condition.

Bank Finds Chicago Electric Railways' Progress Remarkable

Northern Trust Company Recommends that Any Doubters About Essentiality of Electric Railways Should Study Local Roads

THE growth of electric railways in the Greater Chicago district in the face of tremendous increases in the use of private automobiles and buses and higher costs of operation is regarded as "little short of miraculous" by one of the largest banking houses in the great midland financial center.

A recent issue of "Bond Briefs," a bulletin published weekly by the bond department of the Northern Trust Company of Chicago, makes the following pointed observations:

The progress of the electric railways of the Chicago district in this typical period is little short of miraculous. In 1915 the three electric interurban railroads which enter the Chicago Loop (the Chicago, North Shore & Milwaukee, Chicago, Aurora & Elgin and Chicago, South Shore & South Bend Railroads) carried 13,004,588 revenue passengers. By 1925 this number had grown to 26,474,522, or an increase of more than 100 per cent, a rate of growth considerably in excess of the rate of increase in the population of the Chicago territory.

The comparison of the 15 per cent national growth with the 100 per cent increase in Chicago naturally leads to the question, "Why is the rate of increase in the Chicago district so far ahead of the rest of the country?"

The answer, of course, lies partly in the tremendous development of the Chicago suburban districts, which has increased correspondingly the number of potential customers, but much of this demand might have been lost to bus lines or other competitors if it had not been for the progressive policy of the electric railways of this territory. This policy has been expressed by one of these companies, as follows: "It is our obligation to provide the kind of transportation the public wants, regardless of what the variety may be, and not merely to give service of a character which may be the easiest way."

Tangible evidences of this policy may be noted in the introduction of limited as well as express and local trains, the operation of dining and observation cars, the use of monthly commutation tickets, the operation of bus services co-ordinating with the electric services, the connections with the elevated trains in the Loop and freight, merchandise dispatch and the newly introduced refrigerator car service.

The bulletin remarks favorably on the practice of the North Shore Line of consulting with riders on various matters of service, calling particular attention to the contest held last summer for the selection of names for the nine new stations on the Skokie Valley line. The custom of the Chicago, Aurora & Elgin line of sending personal letters of welcome to all people purchasing commutation tickets who had not purchased such tickets in the preceding month was also highly praised by the bank.

The bulletin then proceeds to discuss the matter of expenditure made in improving the physical properties. Thus it says:

The electric railways of the district have also spent substantial sums in improving their properties. The North Shore Line, for example, had a valuation of $12,251,977 in 1916. Since then, to the end of 1925, more than $22,000,000 was spent on right-of-way, track improvement, stations, cars and other equipment, bringing the value of the road above $34,000,000. The Aurora & Elgin and the South Shore Line have invested extensively in a rehabilitation program, including rock-ballasting, renewal of ties and rails, installation of wigwag and flash signals at crossings (necessitated by the great increase in automobile traffic) and a modern comprehensive system of block signal control.

Another interesting step on the part of the electric railways serving this territory, says the bulletin, has been their success in creating traffic by stimulating the upbuilding of the territory which is adjacent to their lines. In conclusion, the bulletin adds:

The success which these three electric railways have enjoyed under progressive management is an indication of the possibilities of electric railways. The series of failures which followed the first great era of traction development from 1897 to 1907 has given a wrong impression that this type of transportation is not economically sound. These early failures, however, were due to three causes:

1. The construction of roads not justified by traffic demands.
2. Extravagance and waste in construction, often for the benefit of the promoter, and usually resulting in overcapitalization.
3. Poor management.

From its own study of the situation which affects such properties the bank is led to conclude that the future of the interurban railway, intensively run, is secure. It says:

Experience in the Chicago district has shown that a well-constructed electric railway operating between two centers, or from an important city to its suburbs, if progressively managed, can provide excellent service to its passengers and a fair profit to its owners. Any one who has doubts as to the future of the interurban railroad business need only study the situation in Chicago to see what great possibilities lie in this field.

Co-ordinated Service Recommended for Canton, Ohio

In Report to City Committee on Public Utilities the Beeler Organization Recommends a Single City-wide System Including Cars and Buses—Elimination of Competing Bus Lines Is Urged in Order to Permit Improvement of Service to All Sections of the City at Reasonable Cost

CO-ORDINATION of all rail and bus lines in a single system to be operated by the present railway company is the outstanding feature of a report on transportation facilities in Canton, Ohio, recently made to the committee on public utilities of the City Council by the Beeler Organization, engineers and consultants, New York City. The unsatisfactory results and excessive cost of the present dual service are pointed out and detailed plans for the co-ordinated service are given. The report proposes the retention of the greater part of the street railway trackage, but in the interests of economy and improved service, consolidation of many of the bus routes is considered desirable.

Following is a brief abstract of the report, which consists of 94 pages of text and 123 pages of exhibits.

Until 1923 all of the service in Canton was furnished by the electric street railway. During that year rail service was supplemented by buses. This system, a division of the Northern Ohio Power & Light Company, operates four car lines and five bus lines. The rate of fare is 6 cents cash or six tokens for 35 cents. There is a universal free transfer privilege between all its cars and buses. In all the railway has 29.85 miles of track in the city, of which 22.2 is in active city operation. The railway owns 74 passenger cars, 47 being in fair condition and more than adequate for the present maximum week-day requirements of 33 cars. The company operates fifteen buses in city service. The equipment consists of six Reos and three Whites, which probably will not give more than another year of service, and six Six-Wheel buses, which have just been placed in operation.

A complete field survey was made of the local transportation lines, including all-day passenger counts at or near points of peak load for each car line and bus line, counts of parked cars, a study of the routing of interurban cars and buses, and inspection of shops, carhouses, garage and other facilities.

Canton, the county seat of Stark County, has had a steady growth, but its expansion has been greatest in the present century, since the automotive industry began, which consumes a large number of Canton's products. The population in 1920 was 87,091 and in 1925 it had increased to 106,260, a 22 per cent growth. At the present rate of increase there will be a population of about 115,000 by Jan. 1, 1927.

Canton has an extensive business or retail shopping district. The city has a wide range of industries, manufacturing nationally-known products. Excellent transportation facilities are available for bringing in raw materials and the distribution of the finished product. Nine leading plants employ some 11,000 workers. Plans are under way which would require 1,700 additional workers.

Canton's streets are uniformly level and well paved. Roadways vary in width and average about 40 ft. Street cars and buses in passing occupy about 20 ft., or 50 per cent of the roadway of transportation arteries. This leaves 10 ft. clearance on each side of the transportation lane for vehicular traffic. Ample street space is available for the fast, free movement of all classes of vehicles when the progress of traffic is not interfered with by the parking of automobiles.

Most of Canton's streets were constructed before the extensive use of the automobile. At that time it was not intended that any part of the public thoroughfare would be used for storage purposes. During the days of horse-drawn traffic ordinances prohibited hitching of horses in city streets. Horse-drawn vehicles have been superseded by the automobile and hitching yards have disappeared. Storing of automobiles absorbs a large part of the street and slowing down of traffic has resulted in congestion.

Widening the roadways is suggested as a remedy to relieve the ever increasing congestion. In order to bring this about, very often the width of the sidewalk is reduced. Diminishing the sidewalk space that has been dedicated for ages for the sole use of pedestrians will add to the confusion.

It has long been a misdemeanor to use sidewalks for storage purposes. City authorities prohibit their use for display stands or other obstructions that will in

Four Principles of Co-ordination

1. Electric street railway transportation will provide the most economical, adequate, reliable and satisfactory service through congested districts where the density of traffic is the controlling factor and demands the use of equipment with large carrying capacity per vehicle.

2. Buses will care for traffic where the demands for transportation are moderate and without violent fluctuations.

3. Such a co-ordinated system will enable the patron to complete a journey from any point in the city to any other point on the payment of one fare.

4. With a system under one responsible management, the city of Canton will be in the position of enforcing all just and reasonable requirements as to present and future needs and of securing service.

—JOHN A. BEELER.

Digitized by Google

any way interfere with free movement of the pedestrian. Any attempt to change this practice no doubt would bring a storm of protest from pedestrians and merchants. If the reasons advanced for prohibiting interference of sidewalk traffic are sound, then the interference with street traffic should be considered in much the same light.

Use of the family automobile has educated not only the owner of the vehicle but also the traveling public to view the local city service in the same light as the individual service offered by the private auto. Prospective customers become impatient if compelled to wait for several minutes on the city service. Failure to provide a seat for each patron irritates the customer. If the vehicle is poorly ventilated, badly lighted and dirty, the customer's impression of the service is anything but complimentary. Recognition of the private automobile as a keen competitor is no secret. Decreased revenue has resulted from its extensive use, not only through the loss of patronage of the owners, but also through the owner's generosity in picking up prospective customers.

The average fare charged per trip for local city service is less than the cost of private service. Ordinarily cost will influence patronage, but cost in this case is not treated seriously. Desire of the public to ride on rubber is advanced to explain shrinkage of rail traffic. The real causes are the individuality and time-saving of the automobile. There is every reason to believe that its use will grow. The point of saturation is in the far distance. Automobiles will continue to offer keen competition to the city system, regardless of the character of equipment used in its operation or the personnel.

There is no city registration, but figures for Stark County, together with an allocation for the city of Canton on the basis of the United States census population of 1920, should give a fair indication of the number of motor vehicles in use. These figures for the years 1917 to 1925 follow:

Year	Passenger Vehicles, City of Canton
1917	5,170
1918	6,790
1919	8,350
1920	8,460
1921	9,990
1922	12,010
1923	14,730
1924	18,220
1925	19,850

This tabulation shows that there are four times as many vehicles in use as there were eight years ago, or their use has doubled every four years until in 1925 there was a passenger automobile for every 5.35 persons. Probably 23,000 cars will be in use in Canton with the coming of the year 1927.

Counts show that some 3,000 cars are parked daily in the downtown district and in the vicinity of the principal industrial plants. Checks made indicate that each vehicle carries an average of about two passengers. This would be some 12,000 rides daily or about 3,600,000 for a 300-day year. These are passengers that otherwise would be car or bus riders.

Rail Service and Revenue Have Fallen Off

All four rail lines are operated on ten-minute base headways, with additional service on two of them during the rush hours. This service requires 24 cars during the normal hours and 33 during the evening rush.

TABLE I—SERVICE AND REVENUE, CANTON CITY STREET CAR LINES OF NORTHERN OHIO POWER & LIGHT COMPANY

Year	Car-Miles	Car-Hours	Passengers—Revenue	Passengers—Transfer	Passenger Revenue
1923	2,311,160	287,219	12,652,855	2,232,188	$754,495
1924	2,119,992	264,702	11,273,039	1,828,477	674,158
1925	1,758,956	224,874	9,917,301	1,653,620	593,112
1926*	1,611,896	211,061	7,172,939	1,075,547	429,419

* Last six months estimated.

Table I shows that the service and revenue have fallen off in the past four years. This is true of all lines, being especially marked this year because of the strike of street car operators between May 2 and 22. At that time considerable car riding was lost which has not been regained.

One great handicap to the railway service is its low speed of 7.75 car-miles per car-hour. The speed between terminals is only 8.51 m.p.h. Such speed encourages the use of automobiles, and of buses that make 11 m.p.h. The factors that bring about this low speed are waiting at turnouts on single track, making passenger stops on a single-track section where there is a car waiting on double track a few hundred feet away, the use of single-track connecting curves so that the operator must go to the curb to switch a signal light, waiting for change with a fare rate that requires the use of odd cents, and the poor condition of much of the track. Such delays in a city with wide streets, and where vehicle congestion is not serious, not only annoy patrons but also are very expensive. The lines operating over single track are losing an average of from six to seven minutes per round trip in waiting on sidings. If the time in slowing down for sidings is considered, it can be seen that it is taking an extra car on each of these lines to care for the loss in time resulting from the use of single track.

There is a great excess of seats supplied over the demand during most of the day. The industrial lines have marked peaks, which the street cars with their large capacity care for very well, so that little additional service is needed. The opening and closing hours of some of the larger plants are staggered for the various shifts, which makes it somewhat easier to supply them with transportation.

Buses Operated Under Yearly Permits

The bus routes of the company are not operated under its rail franchise, but under yearly permits, as are the independent bus lines. The bus-miles, bus-hours, pasengers carried and passenger revenue are shown in Table II. There has been a steady improvement in all but one line this year. The exception is doubtless due to direct competition by independent buses over a considerable portion of its route.

The principal difficulty with the bus operation is that too much time is spent at the terminals. These buses are making but 8.64 bus-miles per bus-hour while the average speed actually made between terminals is 11.16 m.p.h. This would indicate that about 30 per cent of

TABLE II—SERVICE AND REVENUE, CANTON CITY BUS LINES OF NORTHERN OHIO POWER & LIGHT COMPANY

Year	Bus-Miles	Bus-Hours	Passengers—Revenue	Passengers—Transfer	Passenger Revenue
1923	129,659	15,136	320,573	90,553	$18,949
1924	252,137	29,816	697,477	180,161	41,260
1925	293,543	39,298	859,951	197,599	51,298
1926*	456,762	58,669	1,232,758	226,206	73,635

* Last six months estimated.

the drivers' pay is for time when they are not working. It can be remedied by through routing.

The first bus operation in Canton of any consequence was by independent lines, beginning about 1921 with four buses. The number of independent buses in use has gradually increased until at present there are 36 registered. The average seating capacity of these is 24 passengers. There are eight operating companies or individuals, operating twelve lines. The routes are shown on one of the maps. The older buses are uncomfortable and unattractive and many of the newer ones were second-hand when placed in service. Licenses are issued by the Mayor for the period of one year, a fee of $30 being paid for each bus. Individual surety bonds or accident insurance policies must be filed and buses are required to conform to routes and terminals designated by the Mayor. The ordinance provides no effective control. The rate of fare charged is 5 cents, with transfers issued to other independent bus lines for 1 cent. The map shows that in many cases these lines operate directly over or encroach upon the car lines. There are some places, however, where the independent buses are supplying sections without needed service.

Six routes are operating on a ten-minute headway, three on fifteen minutes, two on twenty minutes and one about every 35 minutes. During the normal hours 27 buses are in operation. Additional service is given on a few lines in the rush, bringing the maximum number operated daily up to 32 buses. The schedule gives about 4,542 bus-miles and 494 bus-hours. The speed is 9.19 bus-miles per bus-hour, with an actual speed of 11.06 m.p.h.

There are some 7,724,018 passengers carried annually, of whom 6,372,312 or 82.5 per cent are revenue passengers. The passenger revenue, including the 1-cent transfer charge, is $332,133, or 5.21 cents per revenue passenger. This is a revenue of 20.7 cents per bus-mile.

Total Traffic Decreasing in Canton

Traffic carried by the combined transportation systems reached a peak with the year 1923, when 15,983,428 revenue passengers were carried. Since then there has been a recession each year. It is estimated that for 1926 the Northern Ohio city lines will show a decrease of 3,501,368 passengers from last year, or 29 per cent, while the independents will show a gain of 2,655,646 passengers, or 71 per cent over the average business of the preceding three years. These changes are largely the result of the strike of last May.

The financial results of the present competitive operation are shown in Table III. It will be noted that the Northern Ohio system furnished 56 per cent of the service, carried 57 per cent of the passengers, and collected 60 per cent of the revenue. Independent buses in the same period provided 44 per cent of the service, carried 43 per cent of the passengers, collected 40 per cent of the revenue.

In the transportation business competition usually brings duplication. Breaking down of service usually

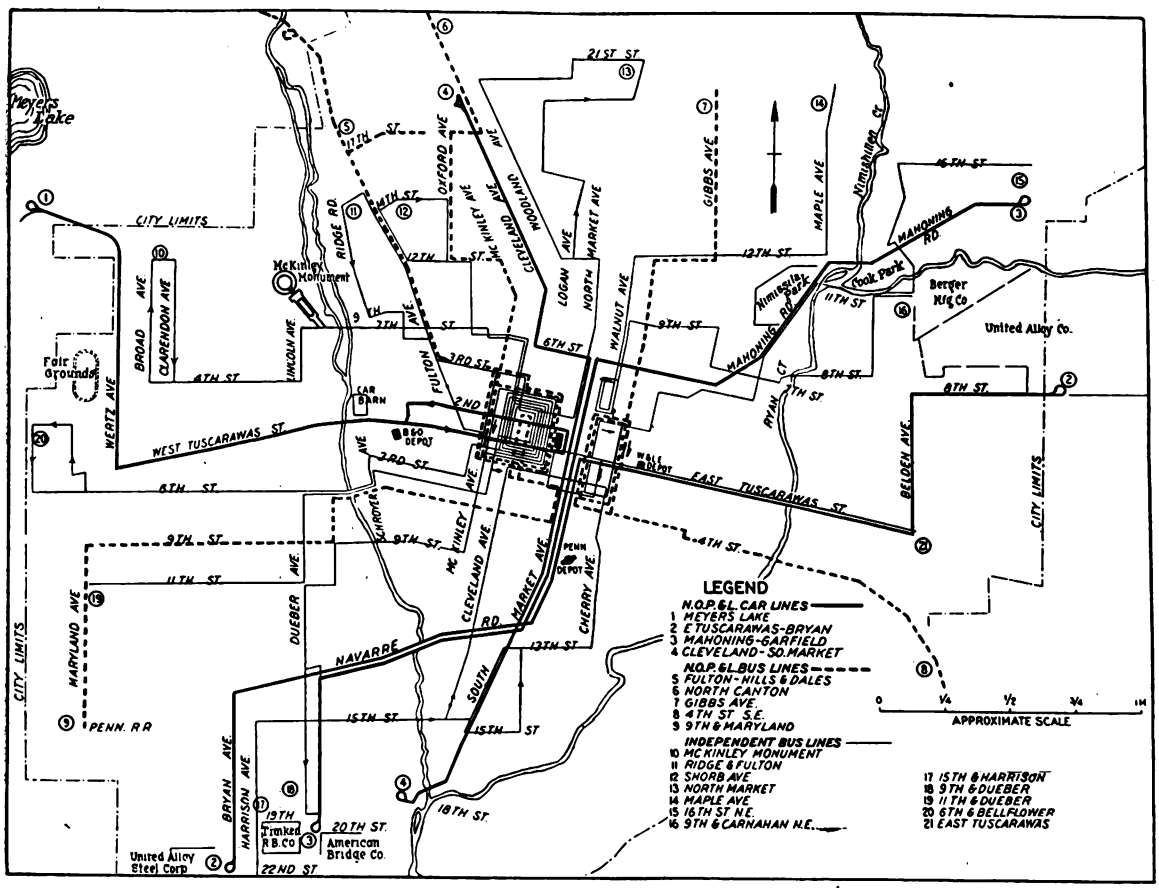
follows duplication, and the effort to meet competition finally forces abandonment of service. Business succeeds only when it pays. The city system in question is no exception to the rule. During the last few years the financial return from operating Canton's local city service has rapidly declined. There is constantly increasing loss through deterioration of the physical property. A portion of the track is not in a good state of repair, and reconstruction under the best standards is an imperative economic necessity. Much of the expenditure now being made for track maintenance is a total loss. Only replacement or retirement will end this expense. The effort to cope with the financial reverses has resulted in abandonment of both service and tracks. The wisdom of this decision can be determined only by the future.



Canton Is Given Local Service at Present by Four Street Car Lines, Four Railway Bus Lines and Twelve Independent Bus Lines

The city's transportation system is virtually part of the city government. One difference is that the transportation system is financed through private capital, while city departments are financed principally through taxation or the sale of bonds. Another difference is that the transportation agency operates under municipal control without municipal responsibility to provide for the cost of operation. On the other hand municipal authorities are charged with the responsibility of providing service by city departments and they are also obligated to collect the full cost of service by taxation or otherwise. This is the true service-at-cost principle.

When independent bus operation was established in Canton six years ago it was not for the sole purpose of furnishing the community with additional transportation facilities but to compete with the old-established rail lines. The new service was inaugurated at a time when the city system increased its rates of fare, and these bus operations were confined to profitable territory. Whenever service has been provided to a community for years and competition is established without a corresponding increase in the volume of traffic serious consequences follow. For a time at least the public may enjoy more service than the traffic demands, even at rates below cost. Such a condition is temporary and not for the best interest of the community. More efficient use of the original facilities would have been to its best advantage. A municipality's responsibility to protect the transportation agency contracted with to furnish transportation service must go hand in hand with its right to control the service.

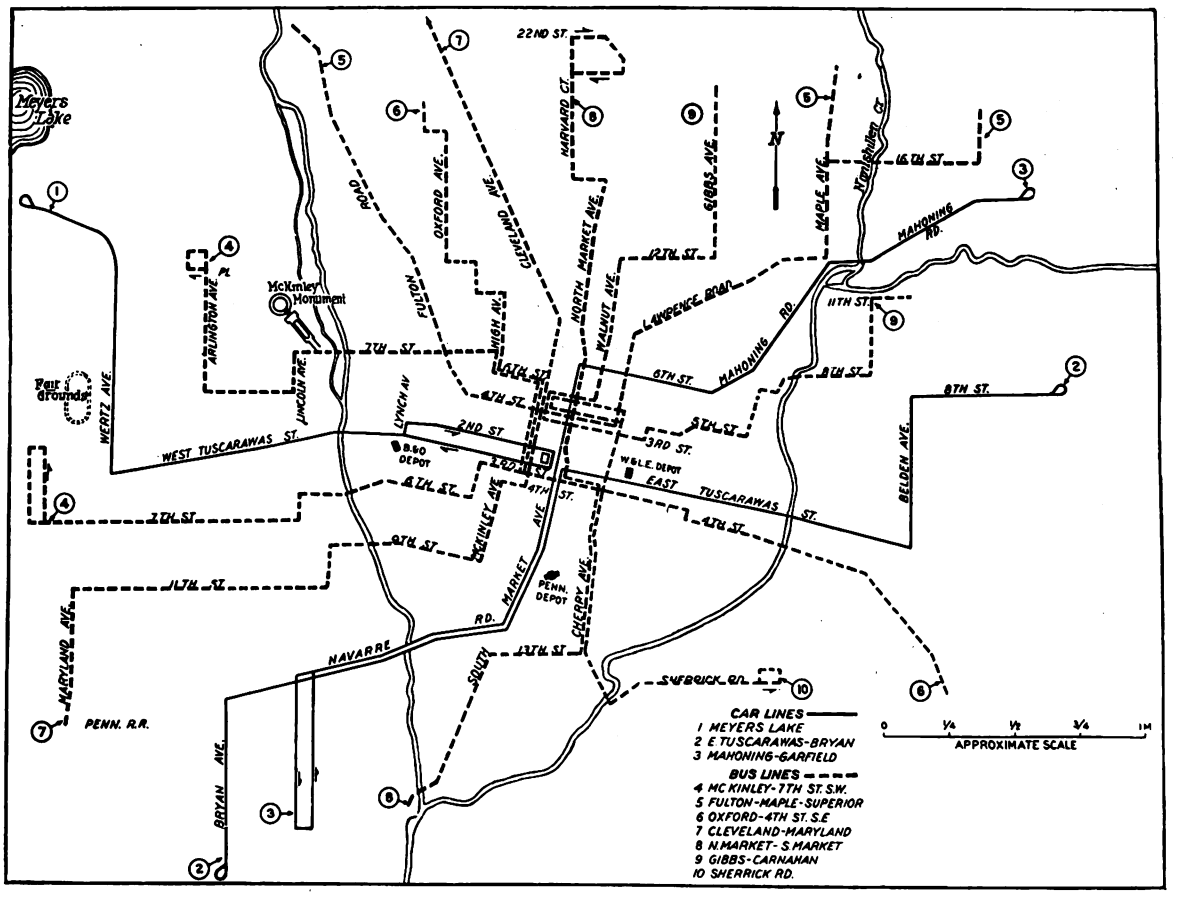
Under the present franchises the municipality has control over the construction, maintenance and operation of the street car system and also the fixing of rates. During the year 1920 its approval was given to an increase of fare. Shortly afterward the municipality issued permits and sanctioned bus operation in competition with the transportation system. If there had been a genuine demand for additional service at that time the municipality was in a position to secure it from the street car system, for it had contracted with its transportation agency to furnish service under terms dictated by itself. Competitive bus service did not bring constructive development. On the contrary it is now apparent that such operation has been destructive, as the city system is on the verge of collapse.

With the present dual operation, service is given where the traffic is heavy without thought of demand or best interests of the city at large. The city's traffic growth has been absorbed by the competitive bus

Digitized by Google

service. Independent bus service did not extend except in proved profitable territory. About 80 per cent of the total population is within 300 yards of the Northern Ohio's lines. Further abandonment of the system's facilities will deprive outlying sections of service they now enjoy. Forcing the system out of the transportation field will place complete control of service with the independent operators. The inability of the city to regulate service without responsible management is obvious, and it is quite evident from past experience that a continuation of the present dual plan will not improve the situation.

Collapse of the railway's system is not due to speculative elements but is the outcome of the present dual operation. During the period 1923-1926 revenue has been insufficient to pay operating expenses, and has not permitted the accumulation of reserves to be used for rehabilitation now necessary. Since the income was insufficient to pay operating expenses it has been necessary to pass up the payment of any return on capital invested in property used and useful in furnishing the service. If the property is to continue to furnish service now, conditions must be created that will make it self-sustaining in order to attract new money necessary for rehabilitation and improvements. If this is not done increasing rates of fare or savings brought about through curtailments of service will but temporarily postpone the final complete collapse of the city system.



It Is Proposed to Give Improved Service in Canton with Three Street Car Lines and Seven Bus Lines All Under One Management

Bus lines are capable of furnishing satisfactory service to some parts of Canton, particularly where the demand for transportation is nominal. The principal value of the bus is the ability to provide facilities to new sections of the city not fully developed and to sparsely settled districts where service requirements are moderate and no great capacity per vehicle is needed, particularly where routing may be changed or extensions desired.

In the industrial sections and active amusement centers, where demands are made to move large volumes of traffic in a short period of time, the ability of the rail service to absorb heavy loads without confusion or street congestion does provide more economical service than the bus. Transportation schedules are arranged to meet normal traffic conditions. Traffic exceeding normal business will naturally result in delays and congestion unless the flexibility of the service or capacity of the equipment provides accommodations for normal and reasonable surprise traffic.

A first-class bus system would require the investment

Building a City-wide Bus System

Results with the independent buses, which gave net earnings of $59,568 available for payments on equipment and interest, are from operation in well-populated territory that has been built up largely through long established service heretofore given by the Northern Ohio system. City-wide bus operation would require the furnishing of adequate service to the city at large, service that would care for the sparsely settled districts as well as the built-up territory. It would also have to care for the heavy rush-hour traffic now cared for by the street railway. Under such conditions the financial result would be entirely different from the present free-lance method of operation, because the lean would have to be taken along with the fat. In other words, they could not continue to skim the cream off the transportation business and leave the skim milk for the street railway that is gradually being starved out.

Digitized by Google

of not less than $925,000. The service would require 45 buses during the normal hours of the day and 65 during the rush hour. Allowing for spares, 75 buses in all would be required. Operating expenses based on 3,766,070 miles per annum would amount to $723,085, or 4.9 cents per revenue passenger. The cost of taxes, renewals and retirements and a 7 per cent return on the investment brings the cost of service to $999,210, or 6.77 cents per revenue passenger for the 14,778,009 passengers estimated to be carried.

Co-ordinated Service Best for Canton

A co-ordinated system would require nineteen street cars and 32 buses in daily operation, making 1,162,160 car-miles and 1,907,855 bus-miles annually. The annual operating expenses before taxes, renewals and a return on the investment would be $606,580, or $116,505 less than for city-wide bus service. Based on the same traffic this is 4.1 cents per revenue passenger.

Comparing results for the period of a 25-year franchise, with a co-ordinated system the portion of the investment in tracks, land and buildings can be expected to give service during the entire time. The investment in street cars at the most would have to be earned and returned twice, while the investment in buses must be earned and returned six times. Under a city-wide bus system a small portion of the investment, that in land and buildings, could be expected to last the entire period, but the major part, or 80 per cent of the investment, must be earned and returned six times. During the 25 years it is estimated that the difference between the two methods will equal a saving of $1,500,000 to $2,000,000 to the riders under the co-ordinated system.

With these facts in mind it can be seen that a co-ordinated system under one management with street cars and buses, each type of service being employed where it is best adapted to the local requirements, will give, under proper regulation, the most satisfactory and efficient service.

The routing for such a co-ordinated system recommended for Canton is shown on one of the maps. Comparison of this with the map of present routes illustrates the contrast between competition and duplication on the one hand and the service best adapted to the requirements of each section of the city on the other hand.

Three Rail and Seven Bus Routes Would Serve the City

Under the proposed plan three railway routes and seven bus routes would be operated. It would be possible to raise the schedule speed of the cars from 7.75 m.p.h. to 9.92 m.p.h. with a certain amount of double tracking and by putting all track in good operating condition. Improvements planned in the track layout in the Public Square are shown in the inset map. The present carhouse is in an advantageous position near the center of the city. It is so arranged that serious delays are occasioned in switching cars in and out. This condition should be remedied and the appearance of the carhouse improved. Present overcrowding of the carhouse would be avoided, as the number of passenger cars needed would be reduced from the present 74 to 26. Under the proposed plan 36 buses would be needed, and suitable garage facilities can be provided by remodeling the unused power station adjoining the carhouse.

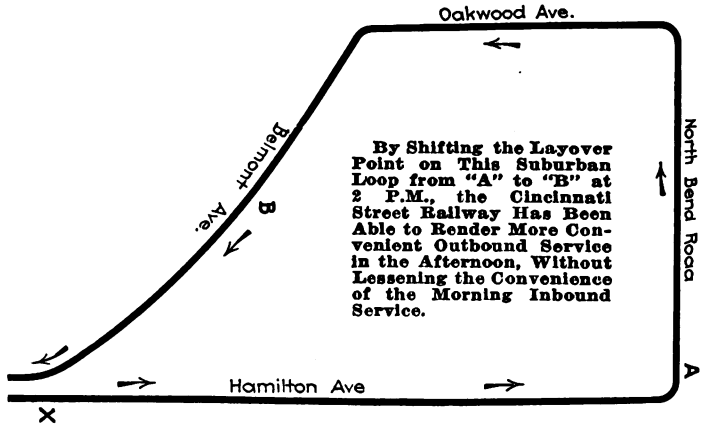
Improving Service on Long Suburban Loops

BY CHANGING the layover points on two suburban lines having long loops at their outer ends the Cincinnati Street Railway effected a substantial improvement in service. The Westwood and College Hill lines, after a run of about 8 miles from the downtown section, terminate in long loops through their respective residential sections. Each loop is nearly 2 miles in circumference. The two suburbs served by these lines are on isolated hilltops and no other parallel lines are available to the residents.

From time immemorial the layover point on each of these loops was, at all times of the day, at the outermost point of the loop, as indicated on the accompanying sketch by the letter *A*. With this condition, persons living along the outbound half of the loop, *AX*, had good service to their homes on outbound trips. However, when they desired to go to town in a hurry they had to walk to the junction point, *X*, or ride completely around the loop with transfer at *A*. One waiting car did not leave the layover point, *A*, until the car behind arrived and it could be learned whether any city-bound passengers, picked up along Hamilton Avenue, wished to transfer.

Just the reverse was true for persons living in the side streets on the other side of the suburb. On the inbound trip these residents had direct service along Belmont and Oakwood avenues. But, returning from town, they had to take the circuitous ride around the loop, with transfer at the end of the line, *A*. Otherwise, a walk across the suburb from the outbound track was necessary.

With a view to relieving this situation a new method of operation was adopted. Until 2 p.m. the layover point remains at *A*; after 2 p.m. cars and crews rest at *B*, well in on Belmont Avenue. This shifting resulted



from a traffic count, which showed that until 2 p.m. more persons were riding into town from College Hill or Westwood, while after that hour the greater number of passengers were outbound. Waiting at *A*, the car covers most of the suburb and proceeds directly to town. After 2 p.m., by proceeding around the loop to *B* before laying over, cars carry most passengers as directly as possible to their homes. Very little transferring to the car ahead is necessary on this system. The same principles are used to guide layovers on the Westwood loop.

Residents of the two suburbs, when interrogated by Hudson Biery, director of public relations Cincinnati Street Railway, expressed approval of the new system.

"Collective Management" Works Well at Pittsburgh

Representatives of Trainmen Make Suggestions at Joint Monthly Meetings with Operating Officials—Disposition Is Reported at Next Meeting — A Summary Is Given of October Proceedings

JOINT meetings of operating officials of the Pittsburgh Railways and representatives of the trainmen's organization have been held monthly beginning in February, 1926. These meetings were inaugurated as a way of showing the trainmen that their co-operation is desired, not merely as obeyers of orders but also as originators of improvements in operation, whether for the good of the employees themselves, the patrons or the company.

At these meetings the accredited officials and other representatives of the union make suggestions. Each is given an "item number" and assigned by the management to the appropriate operating official or committee for consideration and reply at following meetings. How the plan works can best be understood from the following digest of the proceedings on Oct. 26.

The first order of business was the statement by Vice-President Thomas Fitzgerald giving comparisons of 1926 operations to date with the same period of 1925. These statistics, presented in standard form at every meeting, cover revenue for the year to date and for the preceding month, motormen's and conductors' wages, passenger car-miles operated, total passengers carried and status of the balance sheet for the year to date after operating expenses, taxes, payments to the communities, etc. Any one of the 150 or more attendants is welcome to ask questions on points not elucidated in the presentation of the figures.

Suggestions Concerning Employee Welfare

Disposition of some of the suggestions brought up by the trainmen's representatives at earlier meetings was reported by W. T. Rossell, general manager. For example:

Shower baths for a certain carhouse. Suggested June and August; baths completed Sept. 17.

New schedule for Route 75. Suggested July 28. Ready for picking by end of October.

Paper drinking cups for several locations. Suggested July. In use.

Toilet facilities at end of a given line. Suggested July. In use.

Layovers on certain lines. Suggested August. To be considered in making up new schedules.

Tripping hazard caused at a carhouse yard from water-pipe connections for car-washing stand extending to the ground. Suggested August. Reported that these pipes had been lowered and inclosed in a receptacle.

New sand cars for Herron Hill. Suggested August. Now under construction.

Electric lights for crews' room. Suggested August. Completed.

Automobiles fail to stop at crew-change point in front of carhouse. Suggested August. Steps taken to remedy this.

Certain type cars reported to leak at roof in rain. Suggested August. Several of this type already attended to.

Seats for conductors on certain type car. Suggested July. Sample seat installed on one car and approved as satisfactory by transportation department.

Register rods too high on certain type car. Suggested July. Shops prepared to lower rods after further conference between interested parties.

Changing curtains on left-hand side of motorman on certain type cars. Suggested July. This called for changes in longitudinal seats and seat panel. Remodeled car submitted to original reporter, who declared it satisfactory.

Heat for motorman in certain type car. Suggested July. Reported that fabrication of all material necessary for relocation of the operator's heater had been issued and that job would be done in about one month.

Water in certain drinking fountain not cold. Reported August. Suitable coil installed.

Raise motorman's part of platform 1½ in. to keep his feet dry in certain types of cars. Suggested August. Cork mat approved by original suggester with the amendment that the corners be rounded on the side nearest the entrance to prevent passengers from tripping.

Schedule on one suburban route too fast while track remained in present shape, as this led to abuse of the car. Details of worst locations were given. Reported August. Further inspection and necessary repairs were promised.

Hot-water line extension desired from shower baths to wash basin in dispatcher's office at certain carhouse. Done.

Draft reported back of the conductor's position on certain type cars. New weather stripping has been installed.

Suitable covering desired for steel benches in crews' quarters at certain carhouse. Done.

Shower baths at one carhouse reported out of order. Repaired.

Larger quarters requested for a blind ex-motorman who runs a store in one of the carhouses. Suggested June. These quarters were enlarged as desired.

Suggestions for Better Track, Signal and Other Traffic Conditions Along the Road

Drainage of electric switches and splashing. Several trouble spots were reported. A statement was presented showing how each case had been remedied or would be in the near future. In one instance, a drain pipe was being built to a new sewer, and, in another, negotiations were up with the borough to permit street opening for the purpose. In a third case, the needed sewer was "discovered" after a first failure.

Sign for dangerous car turn desired at certain intersection. Suggested July. Reported installed.

Street light wanted at certain corner. Suggested August. Reported as cared for.

Varous suggestions made concerning right-of-way for cars over automobiles on certain narrow highways, parking rules, etc. These suggestions were taken up with the traffic department of the city of Pittsburgh and relief obtained in several instances.

Street lights turned out too early. Suggested August. This led to a conference with lighting company officials, who explained how the turn-off times throughout the year were ascertained and the schedule approved by the municipalities concerned. No change was contemplated at present.

Cut door in a suburban post office building to avoid blocking of track by mail trucks. August suggestion. Inquiry developed the fact that the post office property was leased, so that the change was not financially practicable; also, that the delays were not serious.

Two suggestions were to the effect that the interval allotted by automatic traffic signals at certain intersections be increased. Both suggestions were carried out.

Complaint made that certain concerns operating trucks

Digitized by Google

in the dark hours of early morning do not carry tail-lights. Arrangement was made by the management to get into personal touch with the executives of offending companies. Car operators are provided with a report form to make such inquiries possible.

Light suggested for certain derail switch. Done.

Automatic non-clearance curve signals suggested at given location. Funds therefor have been set aside.

More powerful headlights, similar to those on a neighboring route, were suggested for a suburban line. Suggestion accepted and work under way.

Street light suggested at certain place in an outlying borough. This had been taken up with the borough authorities.

Comments Made on Car Equipment

Rough riding on one of the older series of cars was mentioned in July. Reported that all trucks were being overhauled.

Special adapter for the standard mirror was adopted to make it satisfactory for a certain type of car, following a suggestion made in July.

Suggested painting of stanchions on low-floor cars owing to the flaking off of covering, which left them unsightly. Suggested August. Reported that 200 cars had already been handled.

Window wipers needed new rubber. In hand.

Unsanitary condition caused on certain cars through arrangement of piping that tempts some of the early morning riders to treat it as cuspidor. Suggested July. Plan for covering not yet fully developed, but meantime a "No Spitting" sign of special character will be placed near this piping, bearing the signature of the Director of Public Health.

Air brake and sanding problems as seen by the motormen have led to careful study of conditions on certain types of cars. Scant flow of sand in one case was followed by enlargement of sander ports. On some cars the rear sand levers did not operate freely and called for correction. In certain train operation emergency application with automatic release of sand had a tendency to reduce the air pressure too much. A joint committee is now going into the whole question of sanding and braking improvements.

Suggestions Intended to Help Sell Rides

The suggestions with regard to transfers indicate a deep-seated belief that some persons still manage to get a two-way ride for a one-way fare. On the other hand, some suggestions call for additional transfer privileges. One suggester thought that the liberal provisions of the 10-cent crosstown transfer should be advertised more often so that fewer persons would pay double fare unwittingly. Several others recommended a more frequent cleansing of fare box glass so as to insure that the company got the fare really due.

Other suggestions showing the interest of the trainmen in promoting business were as follows:

Shorten headway on certain route. Now being checked over.

Relocate car stops for greater convenience of passengers, at specific locations.

Install shelter at certain point. Suggested August. Done.

Provide loading platform. Raised platform was impracticable, but a safety zone was provided.

Safety Co-operation with Trainmen

One outgrowth of the interest shown by the men in safety and traffic problems was the selection of a committee to attend the Detroit meeting of the National Safety Council in October, 1926, at the company's expense. The men were told they could select one delegate from each carhouse in any way they saw fit. It was decided to leave the matter to chance by the time-honored method of drawing numbers from a hat. The first number took care of the first choice and the next two were for alternates.

The Amalgamated Association will also, following the suggestion of one operator, appoint a committee of experienced trainmen to call on the City's Better Traffic Committee to set forth the experienced motorman's viewpoint of city traffic conditions and the remedying of their evils.

Praise from Union Executives

The October meeting was marked by the attendance of P. J. Shea, member of the general executive board of the union. Mr. Shea spoke highly of the Pittsburgh plant and said it was in line with the co-operative management plan recommended by President Green of the American Federation of Labor. He was pleased with the way the various suggestions had been taken up by the management. He commented on the difference in conditions from the days of non-vestibule cars to the point where operators could ask for and get more electric heat.

He advised the trainmen to be responsible and not "overload this opportunity." The Amalgamated, he continued, would do all in its power to help along such work as was being done in Pittsburgh. The trainmen were the salesmen of the Pittsburgh Railways. Contented salesmen were always better salesmen than those who have a fight or grouch against the company.

He could see that great results had already been obtained, and with 100 per cent booster co-operation they would be still greater. The men now realize that the officials of the company are putting all the cards on the table, telling the truth from day to day. The old feeling that this or that statement was a lie had gone.

Following Mr. Shea came P. J. McGrath, financial secretary of the union and seventh vice-president of the International. He said that in the old days any union officer caught in company with a railway official was sure to be fired by his members. It was different with meetings conducted in this spirit. In one month more good was done in mutual relations than the old-type business agent could have done in a year, even if he had had no other duties than following up grievences.

Tulsa in 1907

OKLAHOMA street car systems, it is said, never passed through the "horse car" age owing to the fact that they were established after the advent of the electric railway. The fact that horse cars were run in Tulsa for one week as a temporary measure was revealed, however, by a recent historical sketch in the Tulsa *Tribune*. The first street car line was established in Tulsa in 1907, by C. H. Bosler of Dayton, Ohio. On this establishment the *Tribune* states:

The first line was laid on Main Street and at practically the same time a line was run out Second Street to Cincinnati Avenue, then north, past where the Hotel Tulsa now stands. This line was hurried to completion in order to reach an east side addition by a certain date. But while the line was completed on time, the company found itself without electric power. It did not build its own power plant, but had contracted for current from the Tulsa Corporation, which failed to deliver it at the time set. The company was in a quandary as to what to do. Clarence Kline, now the receiver for the Tulsa Street Railway, who superintended the building of the line, found a way out. He harnessed horses to the cars and had them running to the addition in time to fulfill his contract. Horses were used for more than a week.

A Group of Homes Erected on the Property Formerly Owned by the Railway

A Railway Enters the Homesteading Field

Concord Electric Railways Employs Several Interesting Expedients in Tackling the Problems of Small Revenue, Ruinous Automobile Competition, Run-Down Equipment and Public Indifference—Conditions Are Now Improving

"MAKING a little go a long way" is a phrase which needs no explanation to the average railway operator. Methods by which this has been done on a typical smaller community property should be of interest to other railways with similar characteristics and problems.

The Concord Electric Railways, which serves the territory in and immediately surrounding Concord, N. H., has had its full share of difficulties since the able-bodied specter of the private automobile came to haunt the waking and sleeping moments of railway men generally. Owned by the Boston & Maine Railroad, it has been expected by that organization to stand upon its own feet financially and to pay as it goes. Concord is a community of approximately 22,000 inhabitants and, with the small outlying settlements, the railway has a total possible clientele of around 25,000. The largest industry in the community is the Rumford Press, which prints many magazines with national circulation and employs well over a thousand individuals. In addition there are a number of small mills and sundry other industries in the town. As a community, however, the town is comparatively wealthy and an exceptionally large proportion of its citizens own one or more automobiles. Naturally there are many "stormy-weather riders," but in the pleasant summer and fall months the railway is hard put to it to hold its own.

Eight years ago John B. Crawford took over the reins of authority on the local property and assumed therewith the difficult task of convincing the local townspeople that a community without adequate public transportation would be in a very bad situation indeed. At about the time Mr. Crawford came to Concord things were in rather a bad way. Of maintenance equipment the railway was woefully lacking. Its track was run down and the rolling stock left much to be desired.

When the new management took control and began to clean house shop equipment was badly needed, and since no funds were apparently available for its purchase, ways were sought to secure the necessary funds. A happy inspiration suggested the sale of old copper, steel, and assorted junk which had been lying about the shop and storerooms beyond the memory of the oldest inhabitant. The assortment was extensive, and enough money was derived from its sale to provide a lathe, a drill and several other indispensable pieces of equipment.

Funds for Improvements Secured by Sale of Surplus Equipment

What to do with the older cars which were standing about on storage tracks in various stages of disrepair was the next problem. It was decided that since the junk value of the cars would not average more than $250 and since the value of the actual parts and equipment on each car would run at around $1,029, the wisest plan would be to strip the cars and store the parts for use in replacements. Accordingly everything of any possible use was stripped from the ancient rolling stock, even the window glass and sash being salvaged for future use. Several cars were equipped with HL control, and as this type of control has been abandoned by the local road it was planned to sell the equipment when a purchaser could be found.

Next the relative needs of track and rolling stock were weighed and it was decided that the track was so far gone that immediate and drastic steps would have

Digitized by Google

to be taken to repair some of the worst stretches. Money was not available for giving necessary attention to both of these items and since even new cars operating over impossible track would be of little avail the latter was given priority. The existing rolling stock of the company was not neglected by any means, however, but rather was carefully gone over, rebuilt and painted throughout. Just in the past two years the company has adopted the vivid yellow-orange color which is standard on the Boston Elevated, and has found that the results are all that might be desired both in attracting favorable notice on the part of local citizens and in reducing the accident hazard. The company feels that frequent and careful painting is the cheapest form of sales effort which it is possible to make and has spared no effort in keeping its equipment in first class condition.

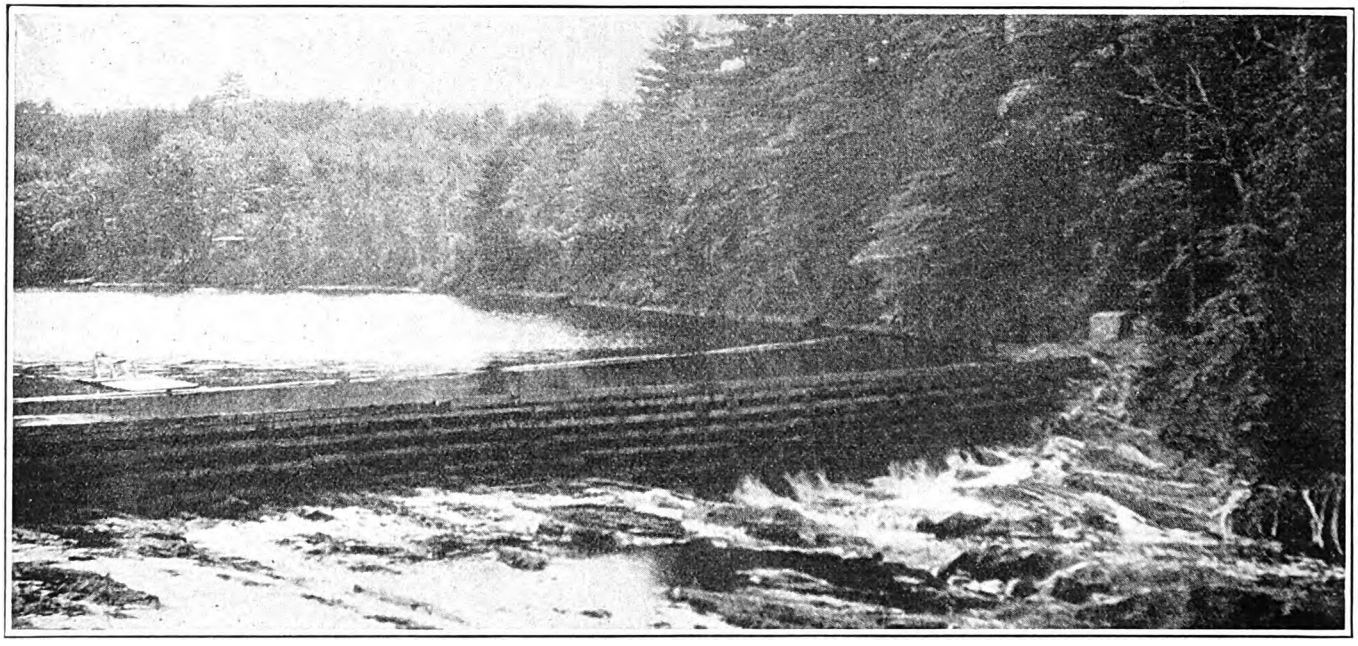
Disposing of Frozen Assets

Having given careful attention to the actual physical equipment of the property as outlined above, Mr. Crawford next began to examine into other and perhaps unsuspected channels of possible revenue. He learned that several parcels of real estate on the outskirts of Concord had been held by the company for years as investments. No income was being derived from these pieces of land and they were a constant drain because of taxes, loss of interest, etc.

At last the expedient of selling the land for subdividing was hit upon. One large section of 40 acres adjoined the trolley line which connects Concord and Contoocook Park and this was sold to the Eastman Home & Development Company. This company will build foundations and the outside structures of houses, leaving the interior work to be finished by the purchasers as time and pocketbook will permit. Thus the development is more attractive to workingmen and people with small incomes, the very type which the railway is particularly glad to welcome into the community. They are unlikely, or perhaps it would be more accurate to say less likely, to own automobiles, and very few of the 28 homes which have thus far been erected on Concord Manor, as the property has been christened, are provided with garages. All of these homes have been built within the past two years and more are constantly going up. Thus the railway was able to dispose of this and several smaller pieces of real estate at fair prices and at the same time to encourage patronage of the street cars.

May Build a Resort Hotel for Working Men and Women

Another large piece of land is owned by the Concord Company on Contoocook River. It is 80 acres in extent, being roughly divided into equal parts which are located on opposite sides of the river. On one side of the river is Contoocook Park, an amusement park owned and operated by the railway company, and on the opposite side is a wide expanse of forest land. Here the company talks of erecting a 100-room resort hotel catering exclusively to working young men and women in moderate circumstances. The charges would be made as reasonable as possible, and as the park and its environs are delightfully beautiful and unprofaned by commercialization it should be a real treat for city workers to spend their vacations there. Incidentally the automobile roads to the park are poor and the trolley is the logical method to be employed in reaching the spot.



At the Extreme Right, the Site of a 100-Room Resort Hotel Which May Be Operated by the Railway

The park itself has many attractions calculated to attract patronage from Concord and nearby communities. Roller skating, free outdoor moving pictures, band concerts on Sundays, dancing, shooting, swimming, canoeing and various other pleasures are at the command of all who attend. Fireworks feature special events and open cars are operated to the parks whenever one of these special celebrations occurs. Patrons who ride to the park on street cars are given admission as a part of their regular fare, while others must pay an admission fee of 10 cents. The park is open from Decoration Day to Labor Day and is a fairly profitable source of revenue to the company. It at least encourages riding on the cars and, further, prevents Contoocook River, which is a natural beauty spot, from being harmed by careless and indiscriminate exploitation.

All of the cars on the Concord property are now one-man operated. This was not accomplished without con-

Digitized by Google

siderable educational work among the local citizens and newspapers. Some opposition was also encountered at first from the unions. However, the whole situation was at last ironed out and now the cars are running with very little hostility to the manner of operation expressed or implied by patrons or men.

Due to the fact that the company has its own hydro-electric plant, its cost for electric energy is quite low. This makes it possible for the railway to operate its cars at an average cost of 21 cents per car-mile, this in spite of the fact that many of the cars are rather old and decidedly heavy. Careful maintenance and a gratifying feeling of responsibility on the part of operators may also be thanked for a large share of the saving.

Business Has Improved This Year

In spite of the ruinous competition with the privately owned automobile, which continues to be used to and from work regardless of the fact that it generally costs its owner around a dollar per day for that privilege, the business of the Concord Electric Railways has shown an improvement during the first half of the present year. This fact is partially explained by the vigorous efforts which are being made to get the trackwork of the company into satisfactory shape throughout the entire system, to improve the rolling stock as much as possible and to keep it thoroughly clean and attractive at all times, and generally to improve public relations with the citizenry of Concord.

Mr. Crawford has done considerable writing for the local newspapers and has also run series of "Traction Tom" and other advertisements. He believes that the only wise policy is to lay all of the cards on the table and to tell the people just what you are going to do and why. The management is always ready to go much more than half way in adjusting grievances, real or fancied. As an example of this the pains which the company took in striving to cut down radio interference by various elements of its system might be cited. Considerable money was expended in examining and repairing all faulty bonds, in supplying converters with soft graphite brushes and in similar precautions. Such efforts as these may be classed as being secondary in importance, for the active salesmanship and aggressive operating practices are even more important in guaranteeing the future of the company.

Buses Do Not Solve the Problem

It has been suggested to the local management that the installation of buses might mark the turning point away from the company's difficulties. Careful examination of local conditions disclosed, however, that buses could not be operated over the type of roads in and about Concord for much under 35 cents per bus-mile. This is a very poor comparison with the 21 cents per car-mile which the present street cars have accomplished. Furthermore the company believes that the citizenry of Concord who would ride in buses are equally willing to ride in the street cars, the wealthier classes being largely indifferent to any and all forms of public transportation except at such times as their own automobiles are unable to traverse the highways.

In conclusion it is interesting to point out that some time ago, when the Eastman Home & Development Company, which was the organization to take over the railway's property and subdivide it, attempted to make a similar development of a piece of property in East Concord it was unsuccessful, due to the fact that no street car line adjoined the property. The type of people looking for inexpensive homes were not interested in lots unless served by public transportation. Hence it would appear that the Concord Electric Railways has a real mission to fulfill in this territory. Its economies and temporary makeshifts have served it well. It is characteristic of the more progressive type of management that the company should be planning today, not for tomorrow or for next year, but for the needs and probable public demands of several years hence.

Trucks Turned to Advantage by Ohio Interurbans

DROPPING the old attitude that truck lines are competitors and taking them under its wing, or rather hooking them up as a part of its system, the Southern Ohio Public Service Company, operating the electric interurban line between Columbus and Zanesville, Ohio, started a freight service that has given Columbus wholesale and jobbing houses a distinct advantage in the territory beyond Zanesville as far east as Cambridge.

To make this possible it has taken more than a year of effort by the company operating the interurban line to interest truck line operators in filing a schedule of rates with it, the Public Utilities Commission and the Interstate Commerce Commission. This now makes it possible to give a through rate from Columbus to points in the territory affected by combined transportation of electric line and trucks.

Under this arrangement the interurban line has become a feeder for the truck lines and vice versa, and as a result Columbus wholesale merchants have gained a distinct advantage, with a selling point in their favor because of the reduced time in delivery of orders.

Prior to the establishment of this combined service three days was required for delivery of orders by Columbus firms to their customers in Cambridge. Under the present arrangement freight delivered at the freight station of the interurban line, at Third and Rich Streets, before 4 p.m. leaves Columbus at 11.25 p.m., and arrives in Zanesville at 6 p.m. the following day. There it is picked up by trucks and delivered at the place of business of the Cambridge retail merchant by noon or before.

Points other than Cambridge in the eastern section of the state benefiting by this service are Adams Mills, Buffalo, Byesville, Conesville, Coshocton, Crooksville, Dresden, Frayersburg, New Concord, Norwich, Pleasant City, Roscoe, Roseville, Trinway and Tyndale.

A Columbus wholesale firm a few days ago was advised by one of its retail customers in Cambridge that for the first time in 30 years he had been able to order one day and receive the next, an achievement he attributed to the new arrangement.

The Columbus wholesale market gains its advantage in the territory affected because other cities are said not to have the means at hand for making deliveries within so short a time as the new service affords to the city of Columbus.

With this service started on the eastern division, operated by the Southern Ohio Public Service Company, similar service is in process for reaching points that can be served on the western division by the Indiana, Columbus & Eastern Traction Company.

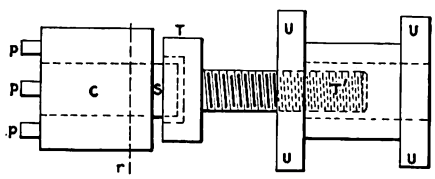
Maintenance Notes

Follower Device for Installing Commutator Nuts

SINCE commutator nuts usually extend in underneath the front edge of the commutator, special wrenches are commonly used for tightening. In the department of electrical repairs of the Brooklyn-Manhattan Transit Corporation commutator nuts are screwed up while hydraulic pressure is applied to force



Details of Follower Device Used in Installing and Removing Commutator Nuts

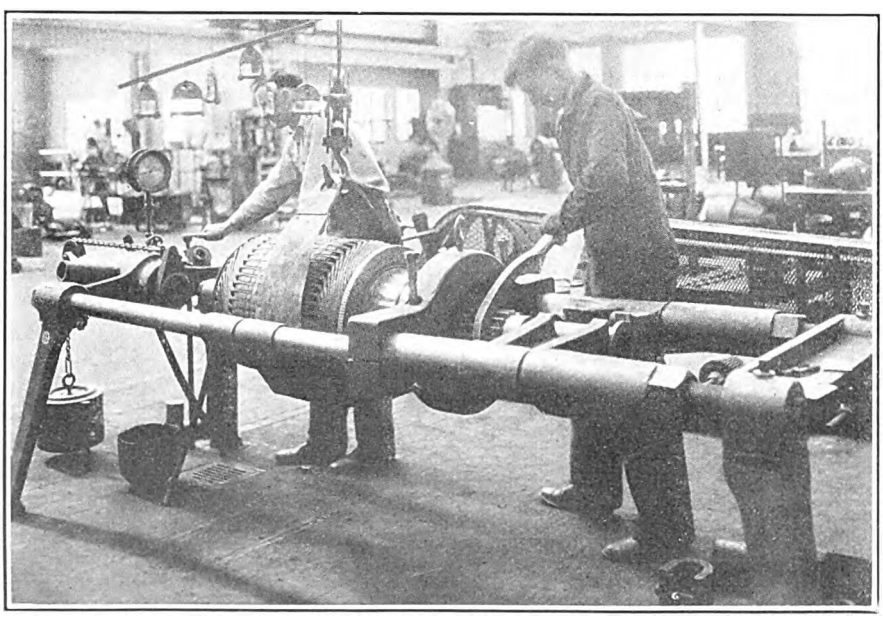
and hold the commutator in position. An accompanying illustration shows one of the company's large railway armatures in a press while the commutator nut is being tightened.

The end of the commutator rests against the crosshead of the press and pressure is applied to the outer end of the shaft so that the commutator is pressed firmly into position. For screwing the commutator nut into position a pinion with dowel pins is used. The wrench is applied to the teeth of the pinion so as to produce the turning movement. In addition to this, a special follower device is used to support the commutator end of the shaft.

The accompanying diagram shows the details of construction of the follower device and pinion. An old pinion with three projecting pins is shown at *C*. This pinion has the bore enlarged so that it will slip onto the commutator end of the armature shaft easily. The three pins shown at *P* engage corresponding holes in the commutator nut as the armature is supported as shown in the halftone. The pinion is used to provide a means for reaching into the commutator nut and enough of the pinion extends beyond the crosshead of the press so that a hook-shaped wrench can be used for turning.

The follower consists of a saddle-shaped casting shown in the diagram at *U*, together with a cupped head screw designated as *T*. The part *U* rests in the tail crosshead of the press. With the armature in place, the cupped head *T* is run up until it almost touches the pinion. The nut can then be tightened or loosened as desired.

The depth of the counterbore in the cupped head *T* exceeds slightly the full travel of the commutator nut so that the head can be run back and forth by hand to keep the dowel pins in engagement with the commutator nut.



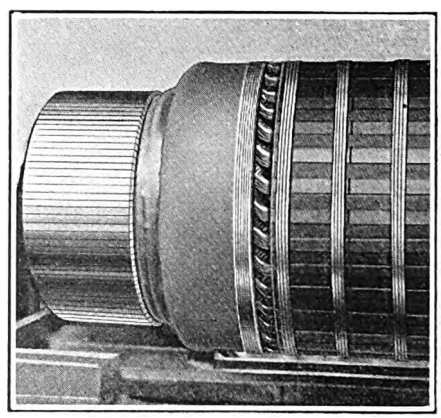
Tightening a Commutator Nut in a Hydraulic Press

Use high-grade carbon brushes to "keep that school girl complexion" on the face of your commutators.

New Canvas Hoods Decrease Armature Failures

EXPERIENCING a considerable number of armature failures due to the collection of conducting substances under the canvas hood necessitated the Wilkes-Barre & Hazleton Railway, Hazleton, Pa., changing the hood design.

It had been the practice to install



Canvas Hood with Exposed Coils

the canvas hood on the commutator end so that it was held under the first banding wire on the armature core. This resulted in an accumulation of brake shoe and carbon dust under and around the coils when they left the core slot, thereby causing grounds and short circuits.

After the old canvas hood is removed the accumulated foreign material is blown out and the coils wiped off and painted with a thick coat of insulating varnish.

The new hood is installed with a separate new banding wire so that about 2 in. of the coil is left exposed where it leaves the slot. This permits of more ventilation and at the same time eliminates the dangerous dust pockets. It is claimed this change has materially decreased the armature failures.

On the Right Side of This Truck of the Capital Traction Company Are the Air Compressor and Oxygen and Acetylene Tanks

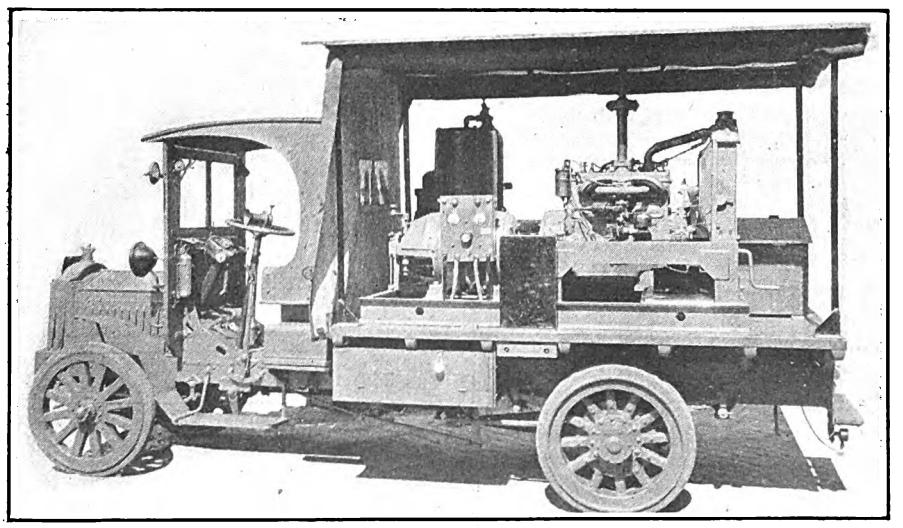
Compressor and Welder Mounted on Truck

FOR various classes of track repair, a truck has been very completely equipped by the Capital Traction Company, Washington, D. C., with apparatus driven by a gas engine for producing a supply of compressed air and current for welding purposes. Gas tanks are also included.

As the amount of equipment carried is quite heavy, it was necessary to use a truck of 2-ton capacity. The equipment comprising the outfit includes a gasoline engine-driven arc-welding set. The generator is a General Electric Company type WD-12, rated at 250 amp., 6¼ kw., 25 volts. This is coupled through a flexible coupling to a 25-hp., 4-cylinder Buda engine which operates at 1,440 r.p.m. In addition to this equipment a DH-16 Westinghouse air compressor is mounted on the truck. This compressor is operated by a 600-volt motor. Attachment plugs and a switch box mounted on the side of the truck are used for connecting this compressor with the underground conductor rail by means of a plow inserted in the slot.

Bearings, like people, are inclined to get "hot under the collar," especially in warm days. Just try a little more oil.

After welds are made, the rails are smoothed off by means of an air-operated emery wheel grinder. By having this as a part of the truck equipment, a complete job can be finished without the necessity of sending additional equipment to the location. Oxygen and acetylene tanks are carried on the truck for welding or cutting with gas and tool boxes are also provided to carry the necessary tools to make minor repairs.



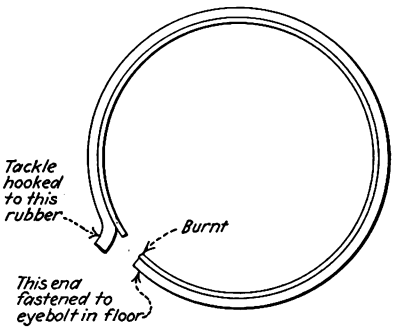
Gasoline Engine and Generator with Switch Box and Plugs for Connecting the Air Compressor to Trolley Voltage. The Air Compressor Is in the Rear Just Back of the Generator

Since with this equipment it is unnecessary to connect the welding outfit to the trolley wire, the welder can do considerably more work than with the ordinary welder, as no time is lost in moving from place to place to get the welder started. Since most of the track operated by this company is of the underground conduit type, it is necessary when using an electric-driven generator for welding purposes to dig up the street in order to make connection to the conductor rail by passing the leads under the wheel rail and into the conduit. With the gasoline-driven engine set, it is unnecessary to do this. The acetylene outfit enables the welder to make such cuts as are required in the rail without having extra apparatus sent to him.

Poorly maintained cars should pass
Into the "pray as you enter" class.

Old Truck Tires Used for Track Switch Plugs

WORN-OUT solid rubber truck tires which had been sold to the junk dealer in the past are now being salvaged and made a part of the railway stock in the shop of the Harrisburg Railways, Harrisburg, Pa. The steel rim supporting the rubber is cut by means of acetylene and the rubber cut through. One end of this split rim is fastened securely to an eyebolt in the floor and a pulling tackle is fastened to the rubber on the other end. By means of the tackle the rubber is stripped free of the rim. After removal the rubber is cut into pieces 2 in. x 2 in. x 1 in. and used for track switch plugs to keep the switch tongue in a set position. It is found that this rubber is very effective for this work due to its live condition.



The Steel Rim and Rubber Tire Are Cut Apart to Facilitate Removal

New Equipment Available

Single Grade of Insulating Oil for Various Uses

OIL of special grade employed for insulating and cooling oil-insulated apparatus such as transformers, circuit breakers, feeder regulators and other oil-insulated and oil-cooled apparatus is being placed on the market by the Westinghouse Electric & Manufacturing Company under the trade name of "Wemco-C." By using a single grade of oil, stocks are much simplified, and after a long period of research development in connection with the oil refiner the Universal oil has been adopted.

Tests made in accordance with Specification D-117 of the American Society for Testing Materials place the dielectric strength of "Wemco-C" oil at 22,000 volts. This result is an average of five trials on the same sample of oil placed between horizontal electrodes 1 in. in diameter with their flat surfaces 0.1 in. apart.

The oil has a viscosity of approximately 57 seconds at 40 deg. C. and 280 seconds at 30 deg. C. The lowest temperature at which the oil will flow, which is called the pour test of the oil, is — 40 deg. C.

The dielectric strength of oil is affected by even a minute trace of water. "Wemco-C" oil is produced under conditions which insure its cleanliness and dryness in the sealed container. In circuit breakers, and to a less extent in transformers, the oil may receive some water in service, and it is important that the oil have the property of quickly separating from the water. This property is known as demulsibility and is determined by the resistance to emulsion test, in which the sample of oil is subjected to steam and the time required for separation of the oil from the water is noted. "Wemco-C" oil has a resistance to emulsion number of 25 seconds.

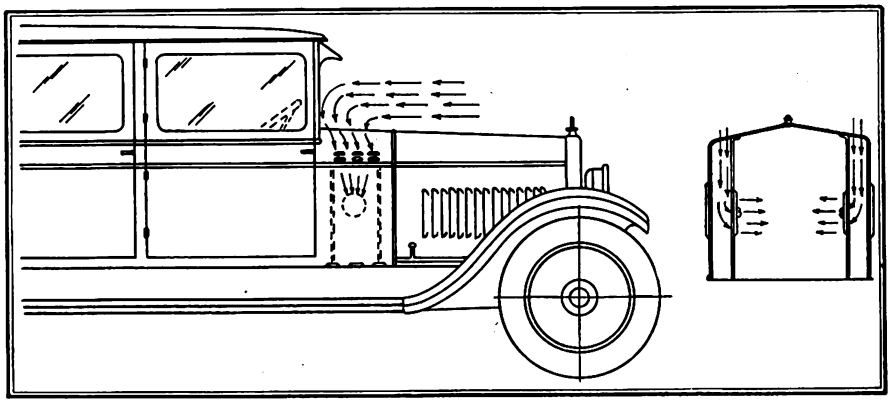
Ventilator for Bus Cowl

BY MAKING use of the air currents that rebound from the windshield of a motor bus and are forced down and around it and the top of the cowl, together with the installation of a ventilator, the Nichols-Lintern Company, Cleveland, Ohio, has overcome some unusual limitations. The Venti-Duct, as this new product is called, ventilates the cowl by means of an air duct. It delivers a strong current of air into the body during rainstorms and in hot weather.

Air is admitted through holes punched in the outside panel. These are trimmed with a suitable fixture. The outer and inner panels are used as walls for the duct. A hole through the inner panel at a suitable point for admission to the cowl and a suitable regulative means, such as the ordinary ventilator grille, together with small drainage holes in the outside panel, complete the device.

The air passes down through the air duct to an opening in the body interior. Located some distance below this opening are several small drain holes. The air rushes to the bottom of the duct and then rises through the opening into the interior of the body. Due to the tendency of the air to rush to the bottom of the duct all rain, snow and other foreign matter are dropped at the bottom before the air enters the body interior. As a result, the Venti-Duct is weatherproof. On the inside of the duct the entrance into the body interior is protected against the direct driving in of rain or snow by a hood or baffle.

As the Venti-Duct can be contained entirely between the outside panel of the body and the interior false panel, its use does not affect the appearance of the body. It can be installed in some form in any type of body. The location of the outer opening is, however, important.



New Type Cowl Ventilator Incorporated in Body Construction for Buses

Operator's version of the "I.W.W."

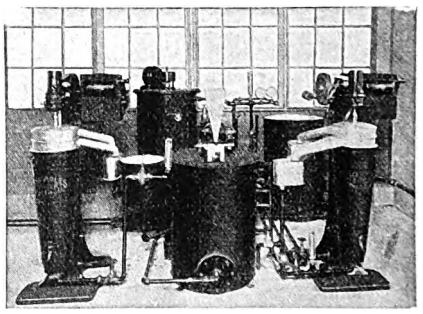
"W"anted.

Circuit-Breaker Oil Reclaimed Cheaply

CONTAMINATED circuit-breaker oil can be purified and maintained in condition to assure safe operation at a cost of approximately 1½ cents per gallon, it is stated, through the use of the Sharples reclaiming process. This is a centrifugal process, which it is stated may be used on circuit breakers, wherever installed.



Complete Sharples Centrifuge Breaker Oil Reclaiming Plant

The operation of this apparatus requires the services of only one man. The contaminated oil is pumped from the supply source at the rate of 150 gal. per hour, through four 6,000-watt heaters, to a 50-gal. mixing tank, where it is mixed thoroughly with the first reagent, with the aid of a motor-driven agitator. The resulting emulsion is fed into a super-centrifuge. The separator discharges the waste water containing some of the impurities, the solid impurities remaining in the bowl of the machine. The mixture is then treated with a second reagent in the second mixing tank and sent to a second super-centrifuge, and from there the purified oil is pumped to storage.

Courage and New Equipment Accomplish Results in Grand Rapids*

BY L. J. DE LAMARTER
Vice-President and General Manager Grand Rapids Railway, Grand Rapids, Mich.

MANY electric railways are endeavoring to win back their old patronage by applying the automotive industry's methods, utilizing the engineer's skill, the master car builder's art, the painter's brush, and adding thereto the lessons learned from successful commercial institutions—courtesy and salesmanship.

Salesmanship of urban and interurban transportation today is one of the vital factors in the life of the industry. Upon it depends the necessary increased revenues, good will and good public relations, but which can only be secured when backed by dependable service. Platform men offer the important contact between the company and the public. Any one conductor or operator meets and serves in one day more customers than most salesmen approach in many days. This being so, unless we give the platform man the right kind of atmosphere and surroundings, a new uniform, a clean, attractive car, a vehicle in keeping with the quiet running automobile our patrons have become used to, a car the employee automatically takes pride in, he will unconsciously not be very enthusiastic in his salesman's efforts, and as a result the company will directly or indirectly suffer.

In Grand Rapids the installation of new and improved equipment with all the refinements and comforts enjoyed by automobile users, with fairly courteous and attentive salesmanship by our platform men, has been attended with very gratifying results. To a large degree it has proved that the combination of attractive equipment, new uniforms and a new order of things has brought —even in the face of a monthly average increase of approximately one thousand automobile licenses issued—splendid results in increased earnings and in the necessary public good will. At the same time operating expenses have been reduced due to the new type of car and the hearty co-operation of the operators, which is reflected in an earnest effort toward power saving and in other ways.

Along with many others, I had long thought that the old, obsolete type of street car could be and should be improved if the industry was to weather the automotive competition and survive. Why should the 1890 type of street cars be operated in these modern times? Why should the same noisy, lumbering and unattractive car, lacking in comforts and refinements, continue to be operated when there were many opportunities for improvement? Why not adopt the same methods employed by the auto manufacturer and improve the type of street railway vehicle to meet the modern, popular demand?

With this in mind I went to Chicago and there met one of the leading car builders of the country.

"What have you that is new in car design?" I asked, after explaining my wants. The car builder reluctantly confessed that he had nothing new to offer. Still my idea, which seemed so simple, so natural and logical, obsessed me. It seemed to me that desirable changes in construction could be made comparatively easily.

Shortly after the meeting in Chicago, fire visited our Hall Street carhouse and destroyed more than 50 of our best cars. Our misfortune and adversity offered the opportunity for the new car design idea to be worked out. Again I conferred with the car builders, after conferring with my own engineers, and explained to them the kind of new electric rail coach I wanted.

I prevailed upon three car builders to enter one car each in a so-called competitive test. Each car builder constructed a coach that he believed would meet with my ideas. The industry is well acquainted with these coaches—the "St. Louis," the "Ohio" and the "Minnesota," which were displayed at the Atlantic City convention in 1925 and which have finally furnished inspiration for many street railways throughout the United States.

Interest of the industry closely followed the coaches from the time of their first appearance until the consignment of 27 new coaches were received in Grand Rapids. Their favorable impression on the public and the practical results they produced to some extent at least has stimulated a general movement throughout the country for better equipment. Harmonious color combinations and other new features, such as low, rakish and streamline body, control cabinet concealing unsightly appliances, etc., easy steps, leather upholstered seats, plate-glass windows, smoking compartments, rubber tiling for floor covering, thermostat heat control and automatic treadle exit, automobile type of bumper, double headlights and names instead of number system are all distinctive features.

June 12, 1926, was set apart as a gala day, a real holiday, to view the parade of the 27 new coaches. Streets were jammed as they had not been since the historic Armistice Day in 1918; city officials, representative citizens, invited guests, descendants of pioneers and early residents for whom many of the new coaches were named, public and parochial school pupils proud of the cars named for their schools and adorned with their pennant dash designs and panel insignia, participated in the colorful pageant of modern street railway equipment. The next day the coaches were placed in service, being dedicated to Grand Rapids residents, and immediately became the pride of every citizen.

A few days later came the street car bonfire at the Fair Grounds. It was a jollification staged for the people by the Grand Rapids Railway to celebrate the new coaches, the beginning of a new era in local mass transportation and to usher in the new order of things. The celebration exceeded even the expectations of the company, more than 50,000 people jamming into the Fair Grounds to enjoy band concerts, illuminated balloon ascension, fireworks display and witness Mayor Swarthout and myself touch the torches at both ends of the line of cars that had outlived their usefulness.

The Grand Rapids Railway's records show an increase in patronage on the lines over which the new coaches are operating, as compared with the older type of car. This proves that giving the people a type of street railway vehicle to ride in, to which they have

become accustomed as a result of the more luxurious trend of the auto, will help restore our industry to the former place it held as a public transportation utility. We realize that civic pride in our railway system is the first step toward public friendship, patronage, fair franchise terms and adequate rates of fare, and our company has made every endeavor to improve the physical equipment with which it is rendering a regular, speedy and safe service.

A recent unsolicited statement by Mayor Elvin Swarthout that any street railway company's effort to improve its equipment, to progress and to give the best service possible is entitled to civic support, is proved by his words:

"The new coaches are more comfortable to ride in than the auto because you have more leg room, more freedom, more comfort and less liability of accident. They are the safest place in the street." His tribute was concluded by this unusual declaration:

"The city must see to it that the railway company is sustained, even if it is subsidized by the city."

It is my firm belief that by progressiveness, courage and service along the lines pointed out the road and the future will become smoother and more cheerful, and with the new order of things, people will gradually return to the street car. Good-will is sure to be further strengthened and all the essential elements combined will help our industry to emerge from stagnation to its proper place in the transportation world.

Co-operation of the Transportation and Mechanical Departments*

By E. W. Miller
Superintendent of Transportation Des Moines City Railway, Des Moines, Iowa

TO GIVE first-class, uninterrupted street car service, there must be existing between the transportation and mechanical departments a true spirit of co-operation. Each department head should be sincere and conscientious in his work, and realize his full responsibility, having in mind that both departments are necessary and must function properly to obtain the results for which they are working. There must be a well-organized program of each department as to every-day customs and practices.

It is the practice of our company for the president, all department heads, company and city supervisors to meet on Tuesday of each week, and all questions that cannot be ironed out satisfactorily between ourselves are brought up at this meeting for discussion and decision. I wish to make clear that questions other than those in dispute are brought up at this meeting, as the president of our company expects each and every department head to be progressive and wide-awake enough to offer constructive suggestions and criticisms.

On our property we have a very definite understanding between the mechanical and transportation departments as to just what is to be done under certain circumstances. To illustrate, in case of a car derailment, when there is a question as to whether or not it was carelessness on the part of the crew, defective car wheels, trucks or other mechanical defects, or bad track, the crew is called in for questioning, the car is pulled off the road immediately, sent to the shop for a thorough inspection, as well as a thorough inspection of track conditions. Our object in this precaution is to do everything within reason to prevent a recurrence of such derailment.

The transportation department directs the operation of all snow sweepers, which sweepers are manned by regular trainmen. The operation of all work trains and work of cleaning and salting switches are directed by our chief engineer, who has supervision of ways and structures. At the beginning of what may seem to be a snow storm, the transportation department immediately gets in touch with the weather bureau; and if it predicts considerable snow, the transportation department gets in touch with the chief engineer, and the heads of these two departments decide to what extent they will call out the snow-fighting force. It has been our policy in the past few years at the beginning of the storm to start our sweepers, work trains and a crew of men to clean and salt switches. By following this plan we have experienced very little interruption in service due to snow storms. We always try to avoid operating snow sweepers during the rusn hours, because during such periods it is impractical for the sweepers to keep in the clear of the passenger cars. During a snow storm, the lines are checked up carefully at regular intervals by two transportation men, who use autos for this purpose. If in their judgment a line needs a sweeper, they so advise the trainmaster, who directs the operation of sweepers.

If we call out our snow-fighting force say at 9 a.m., and the snow storm continues throughout the day, we would keep the full force going until about 5 p.m., at which time the sweepers would be pulled off the road until about 6:30 p.m. The force that sweeps, cleans and salts switches continues at work during the rush hour. Assuming the storm should break about 10 p.m., we would keep our sweepers out until all lines were fairly well cleaned up. After midnight the auto traffic and parked automobiles being off the streets, we would go over all lines with sweeper and clean the track thoroughly, clean and salt all switches, and have men on the job to note that everything is in first-class condition for the early morning cars. This method removes the snow from the rail and flangeways; but unless the snow is pushed back several feet from the rail, as soon as the auto traffic starts, they will crowd the snow back on the rail and in flangeways. We use a snow plow with a heavy wing about 10 ft. long and 2½ ft. wide on right side, set at an angle that it will push the snow about 5 or 6 ft. from the rail. This work must be done after midnight, as it is not practical to attempt this operation with automobiles parked along curbs.

*Abstract of paper presented before the annual convention of the Operators' Section Iowa Electric Railway Association, Nov. 17-18, 1926, Omaha, Neb.

Economic Situation of European Railways†

By L. Boulle
Associate manager Compagnie Générale Française de Tramways of Paris
and M. Bouteau
Manager Compagnie Générale des Chemins de fer Vicinaux of Paris

STREET railway enterprises in the cities of western Europe have been affected during the post-war period by a number of factors, including the following: (1) Increase in cost of labor and material, (2) adoption in a number of countries of a legal eight-hour day which has still further increased the hourly charge of labor, (3) a depreciated currency in many of the countries, (4) reduced riding in still other countries because of business depressions.

The information in this article is based on data received from 42 companies as follows: In Great Britain, 2; Belgium, 3; Denmark, 1; France, 20; Holland, 4; Italy, 1; Luxemburg, 1; Poland, 1; Roumania, 1; Spain, 1; Sweden, 1; Switzerland, 6. In most cases, they represent the largest railway systems in the several countries mentioned.

For convenience in the following comparisons, these undertakings have been divided into two groups. The first are the properties in those countries where the exchange value of the currency as compared with the American dollar is now at par or almost at par. These countries are Denmark, Great Britain, Holland, Spain, Sweden and Switzerland. The second group includes the properties in countries where the currency is greatly depreciated, as compared with the American dollar. These countries are Belgium, France, Italy, Luxemburg, Poland and Roumania. The work of the authors has been somewhat complicated because of the incomplete data received from a number of the properties, as well as because of variations in methods of keeping records and in the nomenclature adopted for accounts. The results given in the accompanying tables, therefore, can be considered only ap-

TABLE I—SHOWING CURRENCY EXCHANGE RATIOS AND PRICE INDEXES FOR THE COUNTRIES MENTIONED

	Exchange Ratio of Paper Currency in U. S. A. Dollars			Price Index of Commodities on the Basis of 1914 = 100 b			
				Wholesale		Retail	
	1913	1919	1925	1919	1925	1919	1925
Group 1							
Denmark	3.73	5.27	4.02	340	157	212	210
Great Britain a	4.86	4.40	4.81	c 307	160	215	173
Holland	2.49	2.66	2.49	304	155	195	179
Spain	5.18	5.25	7.05	204	188	174	189
Sweden	3.73	4.68	3.73	330	155	257	176
Switzerland	5.18	5.43	5.17	d 191	161	261	165
Group 2							
Belgium	5.18	10.36	22.01	d 368	565	d 468	534
France	5.18	10.99	26.81	356	555	238	399
Italy	5.18	13.07	24.79	366	690	280	598

a—In the case of Great Britain the exchange rate given is the value of the pound sterling in American dollars. In the case of the other countries, the figure represents the number of units of currency of the country required to equal the value of an American dollar.

b—Wholesale prices are 1913 instead of 1914 for Great Britain, Holland, Italy and Spain. For Denmark and Sweden some wholesale prices are for 1912 and 1913. In the table of retail prices the figures for Great Britain are for 1913 and for Holland are for 1911-1913.

c—1920.

d—1921.

proximate. These tables include in Group 2 only Belgium, France and Italy, as the data from Luxemburg, Poland and Roumania were not complete and also because the great changes in currency of Poland and Roumania made the statistics from those countries especially difficult of comparison.

As a preliminary, Table I is given to show the economic and currency situations in the countries mentioned.

Fluctuation in Gross Receipts

A somewhat corresponding variation to the figures in Table I will be found in an examination of the gross receipts of the electric railway undertakings in the countries mentioned, though differing greatly in the two groups mentioned. Thus, the gross receipts of the railways in Group 1, with the exception of those in Spain, show a fairly continuous trend. This trend can be divided into three parts as follows:

From 1913 to about 1918 or 1919 there was a gradual but continuous increase in gross receipts, amounting to approximately 30 per cent at the end of the period as compared with 1913.

From 1918 to 1921 there was a very rapid increase in the gross, resulting in 1921 in receipts in some cases double those of 1913.

From 1921 to 1925 there has been a gradual decrease in gross receipts of the properties in Denmark, Great Britain, Holland and Switzerland, and a gradual increase in Spain.

It is not difficult to explain these variations. During the war, even in the neutral countries, there was an abnormal activity of affairs which interfered with the ordinary development of traffic. Immediately after the armistice this condition subsided, but the restraints on general travel, which had existed in many countries during the war, were removed. This with the increased fares, which had been raised because of the depreciation in the currencies, accounts for the greater receipts. It should not be forgotten, also, that in Denmark, Great Britain, Holland and Sweden, the wholesale price index of commodities in 1919 was two or three times that in 1914. In Spain the increase in the index price of commodities was not so great, so that during the last seven years, it did not have so far to fall. It is not surprising therefore that the slight decrease in receipts in England, Denmark and Holland should have been accompanied by a slight increase in Spain.

TABLE II—PERCENTAGE CHANGES BETWEEN 1913 AND 1925

	Gross Receipts	Devalorization of Currency	Wholesale Price of Commodities
Belgium	450	426	565
France	400	517	555
Italy	440	478	690

Gross Receipts in Countries with Depreciated Currency

All of the countries in the group in which the currency has greatly depreciated were belligerents during the war, and in most of the tramway enterprises in these countries, the receipts fell off during the war period, but in the period 1919-1921, the effects were largely similar to those in the enterprises in Group 1. Thus, in 1921 the receipts, on a basis of 100 for 1913, were in Belgium 249, in France 237 and in Italy 438. At the same time the wholesale price index for commodities was, in Belgium 368, in France 345, and in Italy 577. For 1925 the conditions were even worse, as shown by the figures, in Table II.

Professor Seligman to Address Taxation Committee

A MEETING of the taxation committee of the American Electric Railway Association has been called for 11 o'clock Friday morning, Dec. 10, at association headquarters to discuss specifically the merits of the proposed gross-net tax method of utility taxation. In addition to the committee membership proper, the advisory members representing each state in the country have been asked to attend.

The committee will hold a luncheon meeting at the Engineers' Club at 1 p.m., Friday. Edwin R. A. Seligman, professor of economics at Columbia University, has been invited to talk on the general subject of public utility taxation, to which he has given much study and on which he is a widely recognized authority.

Since the subject is of vital importance to the entire industry, Leslie Vickers, economist of the American Electric Railway Association, is strongly urging every member of the committee and of the advisory group to attend this meeting.

Operating Expenses and Return on Capital

Table III gives average increases in operating expenses in the two groups, as compared with 1914. Operating expenses do not include any return on capital. As will be seen, with the exception of Sweden, there has been a tendency for operating expenses to fall to from about 240 to 260 per cent of the 1914 value.

TABLE III—OPERATING EXPENSES OF TRAMWAYS IN THE CURRENCIES OF THE DIFFERENT COUNTRIES COMPARED WITH 1914

	1914	1921	1925
Group 1			
Denmark	100	...	299
Great Britain	100	239	253
Holland	100	309	211
Sweden	100	555	424
Switzerland	100	247	240
Group 2			
Belgium	100	506	659
France	100	396	624
Italy	100	316	457

The return on capital in Great Britain in 1921 was 40 per cent of the return in 1913, and in 1924 it was 99 per cent. If, however, the reduced purchasing power of money in Great Britain is taken into consideration, the average return for the post-war period may be taken as averaging about 30 per cent of the period just prior to the war. The same condition holds in Holland. In Switzerland the situation is somewhat better. The return in 1921 there was from 150 to 190 per cent, and in 1925 from 125 to 180 per cent of the return in 1913.

In the countries with depreciated currency, the returns are far less. Nominally, the French figures show the return in 1921 to be from 100 to 140 per cent of the 1913 figures and in 1925 from 95 to 130 per cent. The figures, however, take no consideration of the devalorization of the franc.

Conclusions

In general it will be seen that while the properties are holding their own on the basis of traffic, the financial returns are not satisfactory and the net returns, especially in those countries where the currency is depreciated, are most discouraging to this class of enterprise. Possibilities for improvement seem to lie, if at all, in a more efficient utilization of the personnel, in improved types of rolling stock and in more scientific methods of operation. Undoubtedly, in an industry where the labor charge amounts to 50 or 60 per cent of the gross, as it does in tramways, a great deal of harm can be caused by ill-considered legislation in regard to minimum wages and maximum hours. Any such legislation which includes personnel of a local transportation company should take into consideration not only the number of hours worked per day and week, but also the intensity of the physical and intellectual effort demanded.

In the direction of improved rolling stock, the cars used at present by the electric railways of western Europe have been designed largely along the

Digitized by Google

lines of steam railroad coaches. The rapid development of the automobile industry indicates that possibilities of improvement lie in the direction of cars patterned more along automobile lines, particularly in the direction of lightness. Unfortunately, any extended change in this direction would involve large expenditures which the industry can ill afford at present.

The greatest possibilities in improvement of operation seem to lie in more careful adjustment of schedules with the thought of economy in mind.

Barcelona Convention Attracts Large Attendance

MORE than 500 attended the Barcelona convention of the Union Internationale de Tramways, de Chemins de fer d'Intérêt local et de Transports Publics Automobiles, held Oct. 10 to 16. This association is made up of electric railway companies and municipal tramway undertakings in western Europe and the governments in a number of countries send official delegates to the meetings. The proceedings are conducted in French and a convention is held every other year. The one in 1924 was in Paris. The president of the association is F. de Lancker of the Brussels Tramways. The Barcelona meeting was honored at its last session by the presence of his Majesty King Alphonso, who expressed his pleasure that Spain had been selected for the 1926 convention and that he personally had been able to be present at one of the meetings.

At the business session of the association no changes were made in the executive committee with the exception that Gosta Hellgren of Stockholm was elected to represent Sweden, Alphons Kuhn of Warsaw to represent Poland and Andreas Falkenberg of Lilleaker to represent Norway. Messrs. Kuhn and Falkenberg occupy vacancies caused by the deaths of the former representatives of Poland and Norway. Invitations to hold the 1928 convention in Warsaw, Glasgow and Rome were received from representatives of those cities, but decision was left to the executive committee.

An abstract of one of the papers presented at the Barcelona convention, namely, "Transportation a Vital Factor in City Growth," by M. Jayot of Paris, was published on page 889 of the issue of this paper for Nov. 13, 1926. An abstract of a paper on "Economic Situation of European Railways," by L. Boulle and M. Bouteau, Paris, appears elsewhere in this issue. A paper on "Bus Body Design in Europe," by J. de Croes of Belgium, was printed in abstract on page 643 of *Bus Transportation* for November, 1926. Abstracts of papers on "Methods of Increasing Car Speeds and Rush Hour Carrying Capacities," by Paul Mariage of Paris; on "Track Switches," by Messrs. Battaille of Liége and Stoffels of Amsterdam, and on "An Index to Determine the Proper Tramway Fare," by R. Haerens of Brussels, and a progress report on rail corrugation will be printed in early issues of this paper. Three extended reports on rail cars for steam railroad service formed part of the program. Abstracts follow of other reports presented:

European Practice on Ties

This report was presented by Mr. Burton, principal assistant engineer Société Nationale des Chemins de fer Vicinaux of Brussels. Based on replies from 31 companies of the international association, the following conclusions were reached on the subject of ties for electric railway track.

Wood Ties.—Wood ties do not appear to be inferior from a service standpoint in electric railway track construction. On the contrary, the wood tie, particularly if of oak, has no superior as a support for the rail. Beechwood ties also give good service, though do not appear generally to have the good reputation which they deserve. This wood is indigenous to central and western Europe and could be employed instead of oak to good advantage. Certain other kinds of wood could also be employed to good advantage. The comparatively short life of pine ties, even when treated, does not seem to encourage their use except under especially favorable conditions. In general, preservative treatment is to be recommended, not only from the standpoint of economy but in the interests of conservation. In track replacements, it is rarely desirable to attempt to reuse the old ties.

Metal Ties.—The greater life of metal ties warrants their use at a price higher than that paid for wood, especially when native woods are not very suitable for ties. Metal ties can generally be reused.

Concrete Ties.—The use of concrete ties is too recent to permit any definite statement on their value, but from a service standpoint they are suitable for use on ballast.

General.—The weakest feature of all types of substitute ties mentioned is the method employed to attach the rail to the ties. In this respect there is little to be said in favor of one type of tie over another. Rail corrugation appears less when the rail is supported on an elastic rather than on a rigid continuous foundation.

Ballast.—Metal ties are not very suitable where the ballast is of a type having an oxidizing effect on metal, like cinders. They also seem to have more of a crushing effect on broken stone ballast than wood ties.

Safety in Car Operation

A report on safety was presented by O. Junyent of the Barcelona Tramways, who pointed out that much less attention has been given to this subject on European tramways than by those in the United States. In the way of safety equipment, European tramways realize the necessity of good brakes and fenders and use safety guards betwen motor cars and trail cars, but few cars are equipped with platform gates or doors. In fact, the only cities reporting their use are London, Amsterdam and Barcelona. Some systems even permit entrance and exit of passengers on both sides of the car on a double track.

While thus somewhat lacking in the use of mechanical equipment, most European systems pay a great deal of attention to the selection and medical re-examination of employees. The rule in Paris is to give motormen a thorough physical examination every five years up to the age of 45, then every three years between 45 and 54, and yearly thereafter. The Paris system also gives a very thorough psychological test to motormen, as described in a report at the last convention. (See ELECTRIC RAILWAY JOURNAL for Aug. 23, 1924, page 280.) At present 22 per cent of the motormen have been selected by this method, and statistics show that they have 16½ per cent fewer accidents than motormen not so chosen.

Fourteen companies of those reporting offer prizes to the motormen who have no accident records. Lyons has instructed its street inspectors to call the attention of passengers who attempt to alight from or board a moving car to the danger of this practice. A number of companies use safety posters.

The report contains a table showing average speed of cars in kilometers per hour and the number of accidents per 100,000 km. operated.

Automatic Substations

Two papers were presented on this subject. One, by M. Lombard-Gérin of the Lyons Tramways, said that automatic substations are comparatively more rare in Europe than in America, one reason being that in Europe labor is comparatively less expensive and automatic equipment comparatively more expensive than in America. However, a number of railway companies, including those at Vevey, Paris, The Hague and his own company at Lyons had installed stations of this kind. The Lyons station transforms three-phase, 10,000-volt, 50-cycle current to 440 volts d.c. and is of 900 kw. nominal capacity, though capable of working from 15 to 20 per cent overload. The converters are of the mercury arc rectifier type. In a paper on mercury arc rectifiers, M. Walty of Brown-Boveri & Company said that his company had equipped and had in service 25 substations, all with mercury arc rectifiers, and that they were giving good satisfaction. He considered that type of rectifier especially adapted to automatic substations.

Railway Motor Ratings

This topic was also considered in two reports. One, by Professor Podoski of Warsaw, gave particulars of tests made by him on six different types of railway motors used on the Warsaw and Lwów systems in Poland, tending to show the effect of passenger stops, grades, forced ventilation, etc., on motor outputs. The other paper on standardization of railway motors, by M. Peridier of the Paris Tramway Company, outlined the conditions which railway motors are required to meet in service. He urged greater participation by electric railway engineers in the work of the International Electrotechnical Commission, which has practically assumed charge of the subject of railway motor ratings.

The News of the Industry

Bus Franchises Delayed—Jurisdiction Questioned

An opinion on the powers of the Transit Commission to fix fares on bus lines operated under a municipal franchise was recently rendered by Judge Charles E. Hughes, speaking in a private capacity. An expression of his judgment was sought by the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., which took exception to the form of franchise of the Board of Transportation requiring the carrier to agree not to invoke the authority of the Transit Commission in the matter of a maximum fare under penalty of forfeiture of its franchise. Mr. Hughes asserted that the city could not fix a 5-cent bus fare, but that the Transit Commission had sole power to make rates.

He contends there would be no forfeiture of franchise if the rate should be raised on the company's appeal. He held that the city derives its authority to prescribe terms contained in franchises from the Legislature, and has no power to fix rates, as this function is exercised by the Transit Commission, with its authority over "common carriers." Admitting that the Transit Commission fixes only maximum rates, Mr. Hughes contended that any effort by the city to fix a fare which the Transit Commission might hold as unreasonable would be invalid.

This opinion, filed by the Brooklyn company with the Board of Estimate, may delay further the awarding of the bus franchises. Mayor Walker expressed the thought that if the provision in the proposed franchise which fixes the rate of fare at 5 cents and binds the holder not to appeal to the commission is not legally binding, the law should be amended to give the city that power. John H. Delaney, chairman of the Board of Transportation, said that if Judge Hughes were correct in this matter, the alternative would seem to be municipal operation.

No comment on Mr. Hughes' bus opinion could be obtained from the Transit Commission.

Kansas City Canvass Under Way

Official canvass is being made of the 13,213 names on a petition filed recently by a committee of Republicans asking for the referendum or repeal on the twelve-year franchise extension of the franchise of the Kansas City Railways, Kansas City, Mo. A total of 11,461 names is required if the petition is to be allowed to stand, it is announced. If the striking off of the names brings the total below the required number, the committee is allowed ten days to add other names to bring it up to the required amount. H. F. McElroy, city manager, stated that fraud apparently had been committed, judging from the similarity of the handwriting of many of the names, and urged that a representative be sent to watch the official canvass. P. E. Cole, former bank auditor, was sent to aid the city clerks in the check of the names. Republican workers are busy now obtaining names to replace the 5,000 stricken from the petition by the city clerk, who held they were not qualified voters and were not signed properly to the petition.

New Nashville Cars in Movies

Movies were made at Nashville, Tenn., of the old mule car, carrying its load of old-time drivers; the new railway parlor coaches and all of the ceremony attendant upon the presentation of the new de luxe cars to the public of Nashville.

Through the courtesy of Tony and Harry Sudekum of the Crescent Amusement Company, a motion picture cameraman "shot" more than 1,000 ft. of film, from the time the parade began until Vice-President J. P. Brown of the Nashville Railway & Light Company, formally presented the new cars to Mayor Hilary E. Howse for public service.

The film reveals the thousands who lined the downtown streets to view the unusual procession, shows the new cars moving in a fleet through town and contains many intimate glimpses of "old timers" who lined the sidewalks and the electric car which was born in 1889. The pictures will be preserved as a part of Nashville's interesting history.

Electric Railroads Can Make Money!

ACTIVITY shown by the Insull interests in adding to their holdings of electric transportation lines in recent years indicates great confidence in the belief that electric railroads can make money under proper management. Taking the North Shore line as a sample of Insull-Budd management it would seem that properties under their control should make money, if any management could do so in a given situation. A glance at the map raises the question whether it may not ultimately be the Insull policy to unite the properties in the Chicago area into a comprehensive system. To this question there can at present be no answer. Studied as a group, however, it is apparent that the securities of the various companies include a number of sound investment issues and some attractive speculations.—*From an Article in Barron's entitled "Insull in Transportation."*

Chicago Mayor Opposes Receivership

In bringing forth a proposal to extend the franchise of the Chicago Surface Lines, Chicago, Ill., for six months after their expiration next February, Mayor Dever recently told the local transportation committee of the City Council that a receivership would be detrimental to the interests not only of the bondholders but of the city and car riders as well. He pointed out that the State Legislature, which convenes in January, will conclude its 1927 session on June 30 and that the city by that time would have had time to adopt a satisfactory traction ordinance and obtain the legislation required to permit unification of the elevated and surface lines.

Alderman Arvey presented to the Council a resolution requesting the transportation committee to consider the matter without delay. He said he believed that Surface Lines officials and bankers were bluffing the security holders into believing no course other than receivership was open to protect them. He said that with a short extension of franchise there would be no doubt about the city continuing to get the 55 per cent of net receipts or the security owners getting their interest payments. Neither of these things would be realized under a receivership. The move would insure the continuance of the 7-cent fare over the city and free interchange of transfer.

Mayor Dever's chief purpose in appearing before the local transportation committe was to push his plan for the immediate building of subways in the Loop district and the adoption of an ordinance providing for the levying of special assessments and their confirmation by the courts.

The Mayor hopes that the execution of such a plan will place the city in readiness for actual digging of the tubes as soon as the settlement of the whole transportation question is reached. He believes it is unwise, however, to start actual construction involving the expenditure of a part of the city's traction fund until the entire traction situation is cleared up.

Representatives of the Wells Street property owners' association were also on hand at the transportation committee's meeting to urge that the "L" structure on Wells Street in the Loop be removed and replaced with a subway. They offered to stand immediate assessment for a share of the cost of both operations.

The so-called Lisman proposal, particularly the financial features of it, continues to be the subject of much discussion in banking and investment circles. This plan has more recently been broadened in discussion to contemplate one ownership for both surface and elevated properties.

New Line Proposed for San Francisco System

Men in public life at San Francisco, Cal., are working on a plan to construct a fast interurban line for train service from the heart of the business district down the peninsula to San Mateo. It is planned to operate five-coach trains on a twelve-minute headway to make the trip in 21 minutes. It is declared that such a project will open up the whole picturesque region south of the city to home settlement, give the city room for natural expansion and boost retail trade.

City Engineer M. M. O'Shaughnessy has compiled a mass of data to aid him. Tracks are already laid as far as Ocean View, 12 miles from San Mateo. It is estimated that $5,000,000 will be sufficient to construct this new line. A charter amendment voted by the people permits the county to build a railroad as a public utility into an adjoining county and recent approval of another charter amendment, it is said, will enable officials of the city to float a $5,000,000 bond issue.

It is claimed that lack of adequate rapid transit down the peninsula has tended to stunt the growth of San Francisco. The proposed line would be an adjunct to the present San Francisco Municipal Railway. It is declared that the work could be completed in eighteen months, but it is not likely that the project will be started until after some existing Market Street Railway franchises have expired, which will not be before two years.

Mr. O'Shaughnessy has two sets of plans for a San Francisco terminal. One is to form a loop at Stockton and Market Streets and the other is to utilize a building similar to that used by interurban trains in Los Angeles.

"J." Lease Hearings to Reopen

An investigation into the figures compiled by the Philadelphia Rapid Transit Company, Philadelphia, Pa., in support of the city-company petition for approval of the Frankford elevated lease was begun in Philadelphia on Nov. 26 by B. F. Morgal, chief of the Public Service Commission's accounting bureau. He has been directed by the commission to aid counsel for certain objectors to the 30-year extension of the lease for the city-built line, in computing exact operating costs of the elevated. The commission announced that hearings would be reopened on Dec. 9.

Opponents of the city of Philadelphia lease with the Philadelphia Rapid Transit Company for 30-year operation of the Frankford elevated line engaged Milo R. Maltbie recently to aid in the fight being waged against ratification before the Public Service Commission. Mr. Maltbie, a utilities expert of New York, headed the commission named by Mayor Moore to plan a comprehensive system of high-speed lines for Philadelphia. When counsel for the P. R. T. and for the Northeast Chamber of Commerce, City Club and United Business Men's Association met on Nov. 29 to thresh out certain data which had been requested by the commission, two of Mr. Maltbie's assistants appeared at the conference. They are George E. Goldwaithe, engineer, and Francis T. Mylott, accountant. Edward E. Roberts, engineer, representing the United Business Men's Association, also was present.

Survey in Detroit

Police Traffic Bureau Suggests Certain Corrective Measures, Though Certain Minority May Be Inconvenienced

A police traffic survey of Detroit, Mich., is now under way which has for its purpose the more efficient and consistent use of the facilities now available. The City Council has voted $30,000 to defray the cost of the survey. The Police Traffic Survey Bureau believes that when the limit of such facilities is in sight plans will have been made for amplification of or additions to them, as required.

If a program of corrective measures is not adopted the only alternative is more ordinances, more policemen to try to enforce them and large sums of money spent for street widenings, arcaded sidewalks, double-deck streets, double-deck sidewalks and many other schemes suggested, all of which cost money and require time for installation.

The following seventeen items show the scope of the work.

1. Determination of vehicular traffic flow and passenger flow at four concentric loops, having the City Hall as an approximate center; supplemented by vehicular traffic flow at isolated intersections throughout the city. Included therein is the timing of the automatic signals now in use and a determination of where additional signals should be located.
2. Determination of points within the city where minor changes, such as cutting back curbs at interesections, removal of billboards and repairs to paving, might reduce the accident hazard and increase the fluidity of traffic movement.
3. Determination of the origin, destination and routes of passenger and commercial vehicles in order to devise, if possible, selected preferential routes for both classes of service.
4. Determination of the relative speeds of street cars, buses, trucks, passenger automobiles and horse-drawn vehicles in different sections of the city and along certain streets, especially the main arteries, in order properly to time and operate the progressively timed automatic signal system now being developed by the signal bureau of the Police Department.
5. Determination of the routes selected by trucks in moving freight and merchandise between freight terminals and the business district and between the business district and residential district.
6. Determination of the use of the alleys in the business district for freight loading and unloading, with the possibility of increasing the use thereof, with a consequent reduction in the use of street space for such purposes.
7. A study of the present routing and loading points of mass transportation vehicles with a view of improving the same where possible.
8. Determination of the origin, destination and routes taken by passengers on mass transportation vehicles with a view of improving the efficiency of the same, where possible.
9. A study of the routes, street stands and movements of "for hire" vehicles.
10. A study of pedestrian movements, direction and volume, at certain congested intersections and along certain congested sidewalks.
11. In co-operation with the Retail Merchants' Association, a survey and study of the transportation habits of customers and employees to and from the stores in the downtown district.
12. A study of the transportation habits of factory employees, store employees to and from work.
13. In co-operation with the Detroit Automobile Club a study of the distribution of automobile and truck ownership in the city.
14. In co-operation with the Associated Technical Societies of Detroit and the Retail Merchants' Association, a study to determine whether or not there is a tendency toward decentralization of the downtown business district.
15. Study of the available "off street" parking space inside the limits of the Grand Boulevard and a determination of the amount and turnover of automobile curb parking in the business district.
16. Study of the available rentable garage space outside the business district and the amount of all-night street storage of automobiles in that territory.
17. In co-operation with the Board of Education, a study of the travel routes of children to and from school in order to provide the necessary protection, such as traffic officers, automatic signals and pedestrian subways where major streets are crossed by the children.

Before the work in hand is completed, city departments and civic organizations will be asked to lend their assistance. In making this survey the Police Department has staged an "open house" policy as regards suggestions for the betterment of traffic movement and control.

New York Comptroller Asks Some Pertinent Questions

Comptroller Charles W. Berry of New York insisted on Nov. 22 on having an answer to the subway questions which he propounded to the Board of Estimate more than four months ago. Until the present administration has settled upon a definite program, he said, he will not vote one cent of money for subway contracts.

The city will be in a position within a few weeks to let $50,000,000 of subway contracts which have been held up pending determination of the proceedings over the prevailing rate of wage law. Before these contracts are let Comptroller Berry will again demand to know how the subways are to be paid for, whether the plan inherited from the Hylan administration will be adhered to and how the subways, when completed, will be operated. He said:

> Members of the Board of Estimate who are responsible for this vast expenditure of money should sit down and count the cost to see how the city is coming out. What we are doing is going right ahead as though there had been no change in the administration. We are committing ourselves to an independent subway.

Further, the comptroller pointed out, subway financing overshadowed all other questions of city finance and there could be really no determination of other pending problems until the subway question had been settled. He said he had no brief for any particular policy, but declared he could not see how the city could go ahead with any of its other projects until the main question had been settled.

He favors the immediate appointment of a board of expert engineers to examine the proposed plan before further expenditures are made on the system, which, he says, will eventually cost $1,000,000,000 rather than the $500,000,000 or $600,000,000 which it was first planned to spend.

Mr. Storrs Back in America

Lucius S. Storrs, managing director of the American Electric Railway Association, returned on Nov. 30 on the *Olympic* from his seven weeks trip to Europe. While this was primarily a vacation, Mr. Storrs took occasion to look over the transportation situation in London, Berlin and various other cities.

Improved Business in Alliance

Use of Weekly Pass an Important Factor in Better Conditions on Eastern Ohio Line—Minimum Fare of 10 Cents Sought

Business Boosters—that's what officials of the Stark Electric Railroad, Alliance, Ohio, consider passes now in use over the company's lines from Canton to Salem, a distance of about 30 miles. Eight kinds are now being issued for transportation over various parts of the division. "I want to thank you from the bottom of my heart for your passes," a prominent Alliance lawyer recently told one of the company officials. "Formerly I spent 25 cents a week for street car tickets, walking to and from work most of the time. Now I buy a pass, use it four times a day, one of the children uses it at night, all for 70 cents. Where you formerly got 25 cents of my money you now get 70 cents."

Plan Perfected in Summer

Plans for using the pass were perfected last summer. That form of transportation was introduced first on Sundays at 50 cents for adults and 25 cents for children. The pass permitted a person to ride as often or as far as he wished. Results indicated that the idea was a good one, for on the first Sunday 400 passes were sold. Results were so promising that the company put into effect similar passes. They are:

Weekly pass between Canton and Salem, transferable to any member of the family, $5; single fare between these two points is about 90 cents.
Weekly pass between Canton and Louisville, 5 miles, $1.
Weekly pass between Alliance and Sebring, 4 miles, $1.
Weekly pass between Damascus and Salem, 6 miles, $1.
Weekly pass in Alliance, 70 cents.
Weekly pass in Canton, 70 cents.
School tickets for children under thirteen, good for ten rides to any point on the line, 50 cents.
Sunday passes for adults at 50 cents and children 25 cents.

So popular has the weekly pass system become on city runs that Stark Electric officials offer to insert in the city franchise a clause which will permit the issuance of passes for the remainder of the 25-year period for not more than $1 a week. The present price of 70 cents a week will not be affected by this clause at the present time. The dollar price is made to permit an increase of the present rate should this be found necessary within the next 24 years.

The peak of the pass system so far recorded shows that more than 700 weekly tickets were issued in Alliance alone.

Company a Pass Pioneer

The Stark Electric Railroad was the pioneer in eastern Ohio to adopt this system. Not many weeks later the Youngstown & Ohio River Line adopted a similar proposition, offering passes for 50 and 25 cents. After a month of this the price of the Youngstown & Ohio passes was increased to $1.50 a pass, due to the length of the ride. The line is longer than the Stark Electric and has no intermediate city like Alliance to shorten the average length of ride. Since September, also, the Northern Ohio Power & Light Company, Akron, has been offering Sunday passes on its southern division between Canton and Uhrichsville.

The latest development in Alliance is a petition of the company before the City Council looking toward a minimum fare of 10 cents. This move is to relieve congestion on interurban cars which has resulted from large city patronage. This minimum fare, if approved by Council, will affect only the Mount Union branch of 2 miles, over which city and interurban cars operate. The same fare, 6 cents, which is charged on city cars will apply on interurban cars operating over city lines where there are no city cars. Three city cars are to be used instead of the present two cars for the Mount Union district if the minimum fare is allowed by Council.

Stops Being Eliminated

To speed up interurban service between Canton and Salem, a distance of about 30 miles, two city stops in Alliance and five in Canton are being eliminated. The Stark Electric "city zone" in Canton has been "moved in" toward the public square about half a mile. The new zone where the 6-cent fare will prevail ends at the old city limits.

House-to-House Canvass in Alameda

Officials of the Key System Transit Company, Oakland, Cal., have resorted to the plan of a house-to-house canvass in order to determine what the public needs in railway service in Alameda, Cal. Canvassers of the company have been instructed to visit every home in the island city and to make a complete report of all criticisms and concrete suggestions that may be offered. George H. Harris, general manager of the company, hopes by this means to obtain suggestions that will make it possible for him to readjust matters so as to stimulate riding.

They Had to Keep Their Cars Up

TIME payments have even had an influence on the painting of street cars. An electric railway in the Middle West a short time ago emerged from financial difficulties to an extent that permitted it to buy some new cars. After only a year of service the new equipment appeared resplendent in fresh-paint jobs, while the older cars have never been painted within the memory of man and apparently will always rattle through the streets in dreary coats of rust.

An observant passenger finally noticed a brass plate on each car which said: "—Trust Company, Trustee, owner and lessor." The cars were financed with equipment trust notes and there is a clause in the agreement requiring that the cars must be properly maintained to keep the sheriff away. — *Wall Street Journal.*

Seattle Rides Free for Two Days

For two days, Nov. 26-27, the Seattle Municipal Street Railway, Seattle, Wash., furnished free transportation between the hours of 9:30 and 10:30 in the morning, to co-operate in the opening of the Christmas shopping season in the downtown district. The merchants of the city, working with the retail trade bureau of the Chamber of Commerce, decorated the streets in the business district with a lavishness heretofore unknown to the thoroughfares, and special preparations were made in all the stores for the entertainment and amusement of children, who were urged to go downtown to view the displays.

In the meantime, the merchants in the suburban district, especially the large University and West Seattle district, protested to the City Council against the free rides, declaring the plan gave the downtown merchants an unfair advantage and was a plot to draw business from the suburbs. The merchants of course rented the municipal lines at a set sum.

Increased Rates for Watertown Sought

The Black River Traction Company, Watertown, N. Y., applied to the Public Service Commission on Nov. 18 for authority to increase its fare rates from 7 cents cash or 16 tickets for $1 to 10 cents cash, seven tickets for 50 cents. The company alleged that for more than three years past over and above expenses of operation, taxes, and interest, it had sustained a deficit for each year and that present revenues were insufficient to meet the cost of service. The Watertown City Council recently waived franchise provisions and consented to the increased fare on determination by the commission, with certain stipulations as to transfer privileges. The company also petitioned the commission for authority to discontinue the sale of the 15-cent round-trip tickets between Watertown and Glen Park, stating that the rate was unjust and unreasonable. It asked permission to charge a 10-cent fare between the two places.

A petition was also filed by the Watertown Transportation Company, a subsidiary of the Black River Traction Company, for authority to increase its fare rates to 10 cents cash fare, seven tickets for 50 cents. The Watertown City Council waived objection to the requested increase on Oct. 18. Certain transfer conditions were provided under this consent. The present bus fare is 7 cents, four tickets for 25 cents.

Los Angeles Will Oppose Fare Pleas

The city of Los Angeles, Cal., is preparing itself to fight the proposal of the Los Angeles Railway and the reported petition of the Pacific Electric Railway. The Los Angeles Railway has placed a request on file with the State Railroad Commission for a raise in rates from 5 to 7 cents. This petition has been referred to previously. It is stated, also, that the Pacific Electric Railway intends to seek another increase in its fares.

Chester Electrification Ready in Year

Assistant Chief Engineer E. B. Temple of the Pennsylvania Railroad, in an address delivered at a meeting of the Engineers' Club at Philadelphia recently, gave a number of details regarding the railroad company's plans that had not been generally known. He said it will be necessary to have all suburban trains electrified so that they may use the subway and the new Fifteenth Street station under Pennsylvania Boulevard.

To relieve congestion in the handling of trains in Broad Street Station, the company electrified the Main Line to Paoli, a distance of 19.9 miles, in 1915. The electrified service now consists of 36 trains each way daily, or 72 in all. In 1918 the Chestnut Hill branch, 12 miles in length, was electrified, and in 1924 the Fort Washington branch, 6.3 miles in length, beginning at Allen Lane station on the Chestnut Hill branch. The service now consists of a total of 88 electrified trains, counting both directions.

On Jan. 27, 1926, the board authorized the electrification of the suburban service to Wilmington, a distance of 28.1 miles, and to West Chester via Media, a distance of 27.4 miles. Telegraph and telephone and certain signal lines between Philadelphia and Wilmington are being removed and replaced by cables in underground conduits. This work is practically completed.

The rest of the job is progressing steadily. The foundations for the cross-catenary suspension and the bridges are nearly all completed on the Wilmington line, and plans are ready to proceed on similar foundation work on the West Chester line.

There are now 138 passenger and baggage cars in use on the Paoli and Chestnut Hill lines. There will be 128 additional cars ready for the Wilmington-West Chester electrification of about 50 trains for Wilmington and 40 to West Chester. A growth in travel is anticipated similar to that which took place after the Paoli and Chestnut Hill electrification. It is expected that the suburban service on these two lines will be operated electrically early in 1928. There yet remains the electrification of the Schuylkill division to Norristown or Phoenixville, and the New York division.

California Surveys Portend Structural Changes

J. H. Dyer, general manager of the Southern Pacific Company, San Francisco, and C. O. G. Miller, president of the Key System Transit Company, Oakland, Cal., admit that surveys are in progress to devise means to eliminate duplication of service on the ferry and traction divisions of the two roads. Five plans are being studied, ranging from slight changes in the interurban traction service to the organization of a joint operating company. As yet nothing definite has been decided. Paul Shoup, executive vice-president of the Southern Pacific, at present in the East, will have the final say.

The two roads now operate parallel lines in Oakland and in other East Bay cities and ferries on a similar schedule between San Francisco and Oakland.

Colorado Line Incorporated

The Grand River Valley Railroad, Denver, Col., was recently incorporated with a capitalization of 50,000 shares no par value. The incorporators, Clare N. Stannard, John E. Loiseau, Harry T. Hughes, and others are officials of the Public Service Company of Colorado, which recently acquired the Grand River Railroad. The Grand River Valley line operates between Grand Junction and Fruita, Col. One of the officials of the road said that the acquisition was a step in its policy of expansion.

"L" Cars Wrecked in Celebration of Grid Triumph

The interiors of two Market Street elevated cars of the Philadelphia Rapid Transit Company, Philadelphia, Pa., were wrecked on Nov. 11 by West Philadelphia High School students, who were celebrating their football victory over the Central High School. At the end of the bachannal 28 students went to jail, after fighting trainmen and police who were summoned for the emergency. The windows of the cars were smashed by seats which were hurled through the glass, the electric lights were broken and the cars were in absolute darkness. Advertising cards in the upper side of the cars were torn from their fastenings and thrown through the broken windows. Later it was decided that fellow students in a tribunal would fix the penalty for the rowdyism.

Strike in Danbury

Railway and bus employees of the Danbury Power & Transportation Company, Danbury, Conn., which operates electric railway lines in Danbury and bus lines between Danbury and Bethel, went on a strike on Nov. 23. At the present time 59 operators are out. Service is being rendered by independent bus lines and taxi companies have been allowed a temporary certificate to supply service between Bethel and Danbury.

Two reasons are advanced as causes of the strike. It is said the new management refused to recognize the union and enter into an agreement similar to the one in force when the road was run under the name of the Danbury & Bethel Street Railway. The other reason is said to be the plan of the railway to substitute buses on many of its lines in the city of Danbury.

The Danbury Power & Transportation Company has long had under consideration the substitution of buses on most of its trolley lines. Since the strike began officials of the company have petitioned the Public Utilities Commission for authority to discontinue wholly or in part trolley service on ten of its routes and to substitute buses. A hearing has been scheduled for Dec. 3 at the Danbury City Hall and conference between officials of the company and a committee of strikers is planned.

$5,000 in Prizes Offered by Foshay

W. B. Foshay Company, Foshay Building, Minneapolis, Minn., public utility operator, announces an advertising contest in which prizes aggregating $5,000 will be awarded for the best series of newspaper advertisements, folder, booklet, single advertisement, slogan, or other form of advertising that may be submitted covering the Foshay utility and investment business. The contest opens Nov. 1, 1926, and closes April 30, 1927. The prizes will be awarded June 1, 1927. The contest rules follow:

1. Every ad should carry the Foshay border and the Foshay signature, as well as the Foshay slogan, "All Your Money—All the Time—on Time."
2. All copy must be centered on one dominant thought which covers our business of financing, controlling and managing public utilities and industrials and the distribution of securities.
3. All advertisements, books or folders must be original.
4. The advertisements may be illustrated or not, according to the taste of the contestant.
5. The advertisements should be submitted in a way that will protect them from damage. We will not be responsible for manuscripts lost in the mails.
6. Send all advertisements to contest editor, W. B. Foshay Company, Foshay Building, 826 Second Avenue, South, Minneapolis, Minn.
7. Contestants are not limited to any number of entries.
8. All contestants must have their entries reach us not later than April 30, 1927.
9. This contest is open to all. The prize winners will be announced June 1, 1927, and the names of winning contestants will be published in your local papers and in our two magazines, the *Foshay Spot Light* and *Net Yields*.

A number of years ago the Foshay doorstep was one office in the First National-Soo Line Building, Minneapolis. The company began by originating and selling its own public utility securities. The organization consisted of Mr. Foshay and one clerk. In 1919, Foshay securities paid $1,312 in dividends; in 1924, holders of Foshay securities received in dividends, interest and maturities $269,734. In 1925 the figures were $443,753. In 1919 the company employed five people and in 1925, 150.

The W. B. Foshay Company controls the Peoples Light & Power Corporation for the purpose of acquiring and operating public utility properties. Through its control of this corporation and other companies, the Foshay company manages utility properties in 107 cities and towns in eight states. These properties supply electricity, gas, water and street railway service to a population in excess of 170,000 people.

Kansas City Would Continue Present Fare

Application for an indefinite continuance of the present electric railway fares in Kansas City, Mo., has just been filed with the Public Service Commission by Bennett Clark, attorney for the Kansas City Public Service Company. Hearings on the application have not yet been set. In previous applications of this nature the commission has granted continuances of six months. In return for a twelve-year franchise extension recently granted, the company agreed to a slight reduction in fares, fixed in the measure at fifteen tickets for $1, making the fare 6⅔ cents.

Buffalo Ordinance Would Prohibit One-Man Operation

Corporation Counsel Frederick C. Rupp of Buffalo, N. Y., has prepared an ordinance prohibiting the operation of one-man cars by the International Railway on important streets. It is expected the City Council will approve the new ordinance. The ordinance designates and defines congested thoroughfares and if enacted would prohibit the operation of one-man cars on almost every local line in the city of Buffalo. All but four routes in Buffalo now have one-man cars and these include all of the important lines in the city.

Fare Increase Awaited in St. Louis

An early decision by the Missouri Public Service Commission on the application of Receiver Rolla Wells of the United Railways, St. Louis, Mo., for an immediate increase in the fares of adult passengers is anticipated. The company now receives 7 cents and has asked an 8-cent base fare or two tokens for 15 cents. The ten days allowed by the commission for both the city and counsel for Receiver Wells to file briefs expired on Nov. 27. Evidence produced at the hearings on Nov. 16 and 17 showed that the system was losing $116,000 monthly under the present fares. Company officials showed that for the year ended Aug. 31, 1926, the railway earned only a 5.2 per cent return on the 1919 valuation of $51,000,000, without considering about $5,000,000 in improvements and betterments added since that time.

Safe Drivers' Club Organized at Joliet

In the interest of promoting safety on the streets and highways a Safe Drivers' Club has been organized at Joliet, Ill., under the auspices of the Chicago & Joliet Electric Railway. The club is an honorary organization composed of automobile, truck and bus drivers who take the pledge of the club to drive safely. There are no dues and the only requirement for maintaining membership is to fulfill the pledge. Membership cards have already been issued to about 500 drivers, 100 of whom are employees of the Chicago & Joliet Electric Railway.

Detroit May Vote on Rapid Transit Routes in March

Reports from Detroit indicate that at the March election voters may be asked to approve or disapprove the rapid transit routes recommended by the Municipal Rapid Transit Commission last August. It will be remembered that on Aug. 16 the commission suggested for approval an initial system of rapid transit involving 46.6 miles of line, of which 42 miles would be in the city of Detroit. The total cost of construction was estimated at $187,798,000, of which $172,011,000 would be required for the sections within the city of Detroit.

Briefly, the proposed system is divisible into four lines, namely: Vernor Highway, crosstown line, 11.2 miles; Woodward-Fort, north and south line, 7.5 miles; Salina-McGraw-Grand Boulevard-Harper-St. Jean, crosstown line, 14.3 miles; Grand River-Jefferson-Mount Elliott-Gratiot, west side and east side line, 13.6 miles.

In its report of Aug. 16 the commission recommended to the Common Council that it should take the steps necessary to submit this plan of routes to the electors at the next general election to be held on Nov. 2, 1926, but action of this kind was not taken by the Council. Now it is being suggested in Detroit that the routes be submitted to the electors at the coming March election.

News Notes

Rerouting in Effect in Baltimore.—The United Railways & Electric Company, Baltimore, put into effect on Dec. 1 rerouting on nine of its lines in the city. The action was taken as a result of the recommendation made several months ago by Kelker, DeLeuw & Company, Chicago, who made a traffic survey of the city.

Freight Business Gains.—Since the completion of its re-electrification program last August and the placing in service of four new freight locomotives freight business on the Chicago, South Shore & South Bend Railroad, Michigan City, Ind., has gained enormously in volume. Revenue from the transportation of freight in the month of September of this year was approximately $1,600 in excess of that earned in September, 1925, while October revenue was more than $2,500 greater than earnings during the corresponding month of last year. A large percentage of this increase is attributed to the growth in shipments of less than carload lots, which business the road is seeking to develop by offering fast, overnight deliveries to any point on the line.

Followers of Neutral Zone Increase.—The St. Louis Safety Council and the Associated Retailers of St. Louis have joined Director of Streets and Sewers Brooks in his efforts to have a neutral zone for street cars when Olive Street is widened from 60 to 100 ft. between Twelfth Boulevard and Channing Avenue. Both organizations contend that the neutral zone will make Olive Street safe for pedestrians and street car patrons and also speed up the car service for the thousands who depend on the cars for transportation. It is estimated that 95 per cent of the users of Olive Street ride on street cars.

Court Fixes Grade Condemnation Rights. — County Judge Wilbur A. Trares at Edwardsville, Ill., on Nov. 17, ruled that the Illinois Division of Highways had the right, in the public interest, to condemn property needed to build an overhead bridge for Illinois Highway No. 4. The Illinois Commerce Commission four years ago ordered the Division of Highways to institute proceedings to condemn property for the viaduct, but the division's authority to do so was questioned by property owners affected. The plan, if carried out, will eliminate a crossing at grade of the highway and the right-of-way of the Illinois Traction System that has been a cause of great concern from the standpoint of safety.

Trolleys to Be Used by Officials.—The Minnesota Department of Administration and Finance has instructed all other departments that state officials and employees must ride electric railway cars in first-class cities instead of hired automobiles. The order follows a long investigation of travel and subsistence allowances. Buses may be utilized only in emergencies. Where automobiles must be hired for lack of other transportation the allowance is 8 cents a mile.

Tacoma Tries P.A.Y.L. System.—The "pay-as-you-leave" system will be tried in Tacoma, Wash., by the Tacoma Railway & Power Company on its Point Defiance line, where outbound passengers will pay their fares as they get off instead of when they board the cars. Passengers on inbound cars will pay upon entering, as usual. If the scheme saves as much time and speeds up service to the extent expected it will be extended to other lines of the company. Mayor M. G. Tennant, in conference with railway officials, approved the plan.

One-Man Cars on Four Lines.—With the installation of eleven one-man cars on the Lamar line of the Memphis Street Railway, Memphis, Tenn., on Nov. 7 the company now has four lines completely equipped with full schedule operating the new type of electric rail coaches. The first line to be equipped was the Peabody line, on which service was started Aug. 11. On Sept. 29 the Second Street-DeSoto Park line was equipped, eight cars being put into service, and on Oct. 26 the Forrest Hill line was equipped, seven cars being put into service. This makes a total of 37 cars, including the Lamar service of the new type now in operation.

Lower Fare in Effect.—The Portsmouth Public Service Company has put into effect a reduced fare on its interurban operated from Portsmouth, Ohio, to Ironton, Ohio. The new fare is 50 cents one way and $1 round trip. The old fare was 75 cents one way and $1.50 round trip.

Exceeded Speed Limit, So Arrested.—Three motormen on the East Ferry line of the International Railway, Buffalo, are under arrest on charges of operating their cars in excess of 15 m.p.h. over a section of track which the city says is in a dangerous condition. The men entered pleas of not guilty when arraigned in City Court. The city is making a test case to determine the validity of the ordinance, enacted after the International Railway did not comply with a ruling of the Public Service Commission of New York State to repair its tracks in certain streets because of their alleged dangerous condition. The new city ordinance prohibits the operation of local cars in excess of 25 m.p.h., except on certain specified streets where the speed has been fixed at 15 m.p.h.

Digitized by Google

Would Put New Schedule Into Effect.—The Virginia Electric & Power Company has filed a petition with the State Corporation Commission for authority to put into effect the new fare schedule for Norfolk, Va., eliminating all zones in accordance with the unified transportation plan approved by the City Council in October. The city has already approved the new bus fare, over which it has control, and specified the company should apply to the Corporation Commission for a uniform increase on street cars.

Modified Loop Plan Will Be Tried.—The loop plan for operation of the Seattle Municipal Street Railway, Seattle, Wash., offered as an economy measure by Clark R. Jackson, superintendent of public utilities, has been rejected by Mayor Bertha K. Landes on the ground that it might cause serious traffic congestion. However, the Mayor announces that a modified form will be given a trial beginning Jan. 1. The loop plan called for turning back all cars at Pike Street. This change in operation provides for a saving of $500,000 a year, Mr. Jackson estimates. Some of the recommendations in the Jackson plan, such as curtailment of shuttle service and shortening of runs, have been put into effect.

Foreign News

Express Railway Opened in Germany.—Between the cities of Dusseldorf and Duisburg, Germany, the municipal authorities have completed and opened to traffic an electric railway express line, 17 miles long. The maximum car speed is estimated to be about 19 m.p.h. on private right-of-way between the cities, although the track is on city street in the two towns.

Japan Extends Tramway Lines—One of the larger cities in Japan is adding 35 miles of line to its existing electric railway system. The cost of this construction will be about 28,000,000 yen ($14,000,000).

Trolley Buses to Supersede Tramways. — St. Helens Town Council in England has decided to apply to the Ministry of Transport for an order to authorize the working of trackless trolley buses over a number of routes. It is estimated that in this way the expenditure necessary for reconstruction of tramway tracks, amounting to £182,000, will be avoided.

England's Horse Car Banished.—What is said to be the last horse car in England has been withdrawn from service. For some time Morecambe, a Lancashire seaside resort, has been using this old-fashioned system of transportation, but on Oct. 4 the town authorities decided to adopt a more modern method and established bus service. However, the old horse cars were not scrapped, nor did they revert to the junk dealer; instead, the municipal tramways committee auctioned them off to people who have painted them up and converted them into greenhouses and garden shelters.

Recent Bus Developments

Chicago Surface Lines Ordered to Add Feeder Bus Service

Delayed for many months by a variety of intervening and protesting petitions, one of which had been filed by the Chicago Motor Coach Company, permission to operate bus service on the northwest side of the city of Chicago has finally been granted by the Illinois Commerce Commission to the Chicago Railways, a component of the Chicago Surface Lines.

The Chicago City Railways, which operates the north and west side surface lines, had asked permission to operate a bus route on Diversey Boulevard between the terminus of its rail lines, at Crawford Avenue and Laramie Avenue. The petition was indorsed by residents of the districts affected.

The rate of fare and the exchange of transfers now prevailing on the surface lines were ordered by the commission to prevail on the new bus route. This will permit a ride to the downtown district for a 7-cent fare by means of transfer. Under present conditions, residents of outlying districts which will be served by the new bus route would pay a 10-cent fare to private bus lines in addition to the 7-cent street car fare.

If the order, issued on Nov. 18, is carried out, this will be the first time any of the surface lines of Chicago has provided motor transportation. In issuing the order, P. H. Moynihan, chairman of the commission, indicated that similar petitions would be granted to the surface lines where transportation was needed, but where the expense of laying permanent tracks would not be justified in view of the sparse population. The city of Chicago is now endeavoring to obtain extension of the surface lines on Milwaukee, Elston and Vincennes Avenue through supplementary bus lines.

Bus Survey in Philadelphia

The Pennsylvania Public Service Commission on Dec. 1 ordered a survey of the bus-loading problem in Philadelphia. Increased congestion due to the extended use of passenger buses caused the move. The survey will be undertaken by the commission's bureau of engineers.

Seeks Lower Fare.—Application has been filed with the Ohio Public Utilities Commission for a new schedule on the Wheelersburg bus line, operated by the Portsmouth Public Service Company, Portsmouth, Ohio. The schedule provides a fare reduction, effective Nov. 25, from 25 cents to 20 cents, if passengers take advantage of the $3 book of tickets. Cash fare on the Wheelersburg bus line will remain at the old schedule.

Opposes Independent's Extension.—The International Railway, Buffalo, N. Y., appeared before the New York State Public Service Commission at a recent hearing in Buffalo in opposition to the application of Leon W. Paxton and Charles McClure, operating as the Akron & Lockport Bus Company, for permission to extend the line so as to give service between Akron and Lafayette Square, Buffalo.

Buses for Charter in Washington.—Residents of Washington, D. C., are being reminded by the Capital Traction Company that "if you are planning an excursion about town, in the suburban communities, to points in Virginia or Maryland, to a football game, a wedding, a dance or whatnot, keep in mind that the Capital Traction Company has a few modern motor coaches and buses for hire for such purposes!"

Winter Excursion Rate Announced.—The Philadelphia Rapid Transit Company, Philadelphia, Pa., announces an intercity motorbus service to New York at the winter excursion rate of $4.75 for the round trip.

New Service on Trial.—Bus service will be established by the Milwaukee Electric Railway & Light Company between Racine and Mygatt's Corners on a two months trial basis. A 10-cent fare with a transfer to Racine city cars will be charged. More than 115 families signed a petition signifying their intention of supporting the new line.

Seeks to Abandon Route.—Authority to abandon the bus route operated by the Indiana Public Service Corporation between Fort Wayne, Ind., and Peru, Ind., is asked in a petition filed with the Indiana Public Service Commission. The line is to continue between Fort Wayne and Huntington. Losses of from 10 to 15 cents a mile are cited as a reason for the discontinuance.

Bus Service Extended in Vancouver.—Electric railway service to the carhouse district at Vancouver, Wash., ceased at midnight on Nov. 8 and bus service was started the next day. This is the latest line of the Portland Electric Power Company in Vancouver to be discontinued. It had been run eighteen years. The Vancouver lines have been operated at a loss for the last three years.

Must Help Pay for Wear and Tear.—Revocation of consent to operate the Bailey Avenue bus line by the International Bus Corporation, a subsidiary of the International Railway, Buffalo, unless the company agrees to one cent per revenue bus mile to the city to help pay for wear and tear on the pavements has been voted by the Buffalo City Council. The Delaware and Delavan Avenue bus lines are not affected because these franchises are for a fixed term and are not revocable.

Seeks Permission for Bus Route.—The Los Angeles Railway Corporation, Los Angeles, Cal., has applied to the Railroad Commission for permission to operate buses along Mines Avenue and Whittier Boulevard from the intersection of Maple Avenue and East Seventh Street to Beldon Avenue. A hearing will be conducted at an early date.

Financial and Corporate

Operating Ratio Reduced

Net Income of Lines in New York State Best in Three Years—Commission Statement Reviewed

Compared with the 1923 returns, the 1924 operating revenues of the electric railways under the jurisdiction of the Public Service Commission, with authority in New York State outside of New York City, show a slight decrease. This is more than offset by lower operating costs, so that the operating ratio has decreased from 83.88 per cent for the former year to 81.50 per cent for the latter year. While increases are observed in the number of passengers carried and in the number of revenue car-miles, they are in each instance less than 1 per cent over 1923 figures.

As in the preceding six years the revenues of this group of utilities have been insufficient to meet operating expenses and fixed charges, although for 1924 the net loss was approximately one-half that for 1922. The commission ascribes this seeming improvement in part to the discontinuance of various unprofitable lines and not wholly to increased efficiency in operation or increased traffic. It says that the complete absence of strikes during the year 1924 is unquestionably a factor in developing this more favorable showing.

On Dec. 31, 1924, only 1,934 miles of road was reported as available for operation as compared with 1,990 and 1,971 at the close of the years 1922 and 1923 respectively. Significant decreases are due to complete discontinuance of operations by the Glen Cove Railroad, Northport Traction Company, Port Jervis Traction Company and Wallkill Transit Company, which companies represent a total of 21.51 miles, in addition to which the Elmira Water, Light & Railroad Company abandoned 16.21 miles and Peekskill Lighting & Railroad Company 2.90 miles. Advice has been received that subsequent to Dec. 31, 1924, operations were not resumed by the Nassau County Railway and Rochester & Manitou Railroad, which prior to that date had reported 1.50 miles and 7.25 miles of first track respectively, thereby reducing the total mileage at the beginning of 1925 to only 1,926 miles. This figure includes various short lengths of track not definitely abandoned, but over which operations have been temporarily discontinued.

In this connection the commission says there have been a number of abandonments consented to by the commission upon hearings which have indicated that such lines are no longer necessary in rendering service required by the public. These include the Oakwood Avenue line in Troy, the Arbor Hill and Country Club lines in Albany, the Seymour and North Street lines in Auburn, the belt line and Geyser line in Saratoga Springs, a large portion of the Kingston Consolidated Railway in Kingston, that portion of the Chautauqua Traction Company's line from the south line of the village of Westfield to the village of Mayville, that portion of the Hudson Valley Railroad extending from Mechanicsville to Ballston Spa and the Kaydeross Park line of the same railroad extending from Saratoga Springs to Saratoga Lake. Service has been discontinued on the Auburn Avenue and James Street stub lines in Utica. In certain of the foregoing abandonments and cessations, bus line operation has superseded the abandoned trolley lines. This is true of the Troy, Albany and Utica cases. Bus service has been proposed in Kingston as a partial substitution, but up to the present has not been provided on account of the failure of the city to give the necessary consent.

At the time the report was made receivers were operating, among others, the Hornell Traction Company, Ithaca Traction, Hamburg Railway, Ogdensburg Street Railway, Westchester Electric Railway and Westchester Street Railroad.

RESULTS OF OPERATION OF ELECTRIC RAILWAYS IN NEW YORK STATE, OUTSIDE OF NEW YORK CITY

Item	1922	1923	1924

Record Travel on Chicago Surface Lines in October

More passengers were handled by the Chicago Surface Lines, Chicago, Ill., in October of this year than in any previous month in the history of the system. Total rides for the month were 135,878,579, against 132,515,318 in October last year. The previous high monthly record was that of December, 1925, when 132,949,516 passengers were handled. The October figures of this year exceeded this figure by 2,929,063.

	1926	1925
January	129,604,602	127,666,571
February	121,282,868	115,830,619
March	131,839,632	128,009,030
April	131,452,899	126,052,447
May	132,939,381	127,542,240
June	132,980,301	125,684,909
July	130,235,208	124,566,209
August	129,214,055	125,002,113
September	127,149,619	122,964,778
October	135,878,579	132,515,318
November	.....	126,788,880
December	.....	132,949,516

With the heavy traffic period of December still ahead of the company, officials anticipate the record may again be broken. In December last year the company put into use 99.8 per cent of all equipment, or all but seven cars, to handle the Christmas shoppers. One hundred new cars have recently been added to the service, representing an investment of $1,600,000. The maintenance schedule has been arranged in such a way as to provide for the use of practically all cars during the Christmas shopping season, in anticipation of a record traffic.

A more accurate picture of the heavy amount of traffic handled over this year and the corresponding months of last year is seen in the accompanying tabulation.

The divisible receipts for October amounted to $716,112 after expenses, taxes, renewals and return on purchase price, against $320,543 in September and $477,959 in October last year. Brief mention of the record for October was made in the ELECTRIC RAILWAY JOURNAL, issue of Nov. 27, page 983.

Despite the record handling of traffic in October, operating expenses in that month were lower than in the previous month and in October last year, when traffic was not so heavy. This reflects the extent to which operating economies have been put into effect. Operating expenses for October this year amounted to $3,852,558, or $37,465 under those of the previous month. In October last year this item totaled $3,962,650.

Receiver Reports on Disposition of Kansas City Bond Funds

John T. Harding, special master commissioner under the receivership of the Kansas City Railways, Kansas City, Mo., on Oct. 29 filed his report of the final distribution of the funds derived from the sale of the first mortgage bonds of the company.

On Oct. 4, says the report, $1,250,000 was remitted to Powell C. Groner, vice-president and general counsel of the Kansas City Public Service Company, purchaser of the railway. On Oct. 26 a further payment of $1,841,815 was made to Mr. Groner.

An additional $1,500,000 to complete the total of $4,591,815 will be paid him later, but at the time of filing delivery was being awaited of the bonds in this amount to Mr. Harding.

The few bondholders who did not participate in the reorganization plans of the old company will be reimbursed to the extent of $195,844, now on deposit for that purpose.

Details of London Underground Operation for 1925

The gross traffic receipts of the so-called Underground Group, London, England, which comprises the Metropolitan District Railway, the London Electric Railway, the City & South London Railway, the Central London Railway and the London General Omnibus Company, Ltd., for 1925 amount to £13,243,652, an increase of £473,451. The aggregate operating expenses are £11,088,255, and these are increased by £268,572 over the previous year. As a result the net receipts of the group in 1925 were £204,879 more than they were the year previous.

In order to carry the traffic 209,379,914 miles was worked, an increase of 13,433,300 over the preceding year. Of these miles 143,943,201 was worked by the omnibuses, an increase of 6,892,666 over the previous year. The remaining 65,436,713 was worked by the cars of the railways. These and other operating data about the group are contained in the accompanying tables.

Arbiter Named in Settlement of Depreciation Fund

The Transit Commission recently appointed Reuben L. Haskell of Brooklyn, N. Y., as its arbitrator of contributions to be made to the depreciation fund of the New York Rapid Transit Corporation, a Brooklyn - Manhattan Transit subsidiary, under its contract with the city. Mr. Haskell, until Jan. 1 last, was County Judge of Kings County. For five years prior to that he was Representative in Congress from the Tenth District, and before that was Assistant Commissioner of Public Works in Brooklyn and Borough Secretary.

At present the New York Rapid Transit Corporation, which operates the Brooklyn-Manhattan Transit elevated and subway lines, is making annual contributions of $400,000 into its depreciation fund for replacements of the railroad and equipment. It already has paid in about $2,500,000 to this fund but the Transit Commission's accountants have recommended that the annual contribution be increased to $800,000.

MISCELLANEOUS STATISTICS OF LONDON UNDERGROUND GROUP FOR YEAR 1925, COMPARED WITH 1923

	Total Railways		London General Omnibus Company Limited		Total	
	1925	Increase	1925	Increase	1925	Increase
Passengers carried:—						
Ordinary	217,914,496	12,033,369	1,236,547,753	78,136,276	1,454,462,249	90,169,745

*The number of omnibuses owned and/or worked by or in conjunction with the London General Omnibus Company, Ltd., is 4,704.
Italics denote decrease.

Digitized by Google

The New York Rapid Transit Corporation has asked that this proposed increase be submitted to arbitration, and under the contract the commission and the railroad each selects an arbitrator and these two select a third.

Bids Announced on Dayton, Covington & Piqua Equipment

Petitions of approval for the sale of part of the property of the Dayton, Covington & Piqua Traction Line have been filed in the federal district court at Dayton, Ohio, by Charles Eliff, receiver for the company. The company stopped operations on Nov. 6.

It is estimated that the total junking price of the line will be at least $115,000, which is $12,000 greater than the highest bid for the property as a going concern. Acceptance of the bid of Jacob Ziskind, Lowell, Mass., for the tracks, trolleys and other smaller equipment was recommended. Mr. Ziskind made a bid of $81,500. Bids of the Ohio Bell Telephone Company for certain poles amounting to $1,694, and of the Buckeye Light & Power Company for other poles amounting to $480 were recommended to the court for approval. Real estate of the company which has not been sold will bring the price up to at least $115,000, it is said. A bid of $130,000 was made by R. C. Coleman, Springfield, Ohio, who sought the line to aid him in getting the bus permit. This bid was rejected.

Melbourne Shows Gain with Higher Fares

Receipts from passengers increased during the year ended June 30, 1926, on the street railway system of the Melbourne & Metropolitan Tramways Board, in Australia. Total receipts from passenger fares during the year were £2,142,234, a gain of £186,794 over the previous year. Part of this gain came from higher fares, as on May 1, 1926, the fares were raised on an average of about 15 per cent. The minimum adult fare on both cable and electric tramways is now 2d., a number of reduced rate return fares was abolished or the amount of the reduction was made less, and fare zones were shortened. The increased revenue received since the alteration in the fare rate indicates a revenue increase of about £280,000 per annum, but recent increases in wages will add about £60,000 per annum to operating expenses.

During the year there were two "go slow" strikes over part of the systems. One, which was on the Essendon Tramway, lasted a month, when it was abandoned by the men. The other involved only the employees of one depot and was referred to the Court of Conciliation and Arbitration, whose decision has not yet been given.

During the year 14.16 miles of cable track was converted to electric traction, approximately 8 miles of new electric railway track was built, 50 cars were added to the rolling stock and more cars have been ordered. Six new buses were purchased, making the total number now in service 56. Extensions were made to the repair shop and other improvements were introduced.

Some statistics for the year ended June 30, 1926, are given in the accompanying table.

RAILWAY STATISTICS MELBOURNE & METROPOLITAN TRAMWAYS, AUSTRALIA

	Cable	Electric	Bus
Revenue from railway operation	£1,048,414	£1,007,210	£97.304
Operating expenses	£847,102	£816,178	£112,289
Vehicle-miles	12,393,911	10,657,728	1,449,710
Passengers carried	127,882,115	99,017,938	7,164,095
Average passenger receipts			
Per vehicle-mile	20.167d.	22.599d.	16.095d.
Per mile of single track	£13,496	£5,948	£2,472
Per passenger	1.954d.	2.431d.	3.257d.
Number of passengers per vehicle-mile	10.318	9.29	4.95

New York State Railways Report for Quarter

A decline in revenues of the lines of the New York State Railways in Rochester, Syracuse and Utica for the quarter ended Sept. 30 over that of a similar period in 1925 is shown in the report for the three months, filed with the Public Service Commission. The net corporate income was $69,303 for the three months of this year, against $151,436 for the corresponding period in 1925 and $217,774 in 1924. The report covered a period prior to the granting of higher fares in Utica and Syracuse. The report does not segregate operations as to cities.

	1926	1925
Operating revenue	$2,307,448	$2,263,753
Operating expenses	1,819,255	1,670,389
Net operating revenue	$488,193	$593,364
Operating income	368,559	442,953
Non-operating income	86,151	86,763
Gross income	$454,710	$529,715
Deductions	385,407	378,280
Net corporate income	$69,303	$151,436

The result for the quarter of 1926 are compared with those of the previous year in the accompanying table.

Approval of Track Removal in Philadelphia

Stockholders of the Union Traction Company met on Nov. 29 and voted approval of the removal of the trolley tracks from Chestnut and Walnut Streets to the Chestnut Street subway. That was the final act of the underlying companies of the Philadelphia Rapid Transit Company controlling the tracks in the two streets.

Action taken by the four underlying companies clears the way for the actual start on the long discussed $20,000,000 surface-car subway from Fifth Street and Delaware River Bridge, under Chestnut Street to West Philadelphia.

More than a majority of the stock of the old Union Traction Company was represented at the meeting. A. Balfour Brehman, vice-president, offered the resolution, which was seconded by Timothy M. Cleary, secretary.

Defaults Decrease $234,615,700 in Four Years

In the year ended Nov. 1, 1926, $20,613,300 public utility bonds were eliminated from the default list through foreclosure, sale or payment, while in that time there was $9,586,000 in new defaults making a total of $129,098,400 still in default. The reduction in the year was $11,027,300. As Dow, Jones & Company, New York, who compile this list each year, see it, the list of defaulted bonds is likely to be materially reduced during the current year, particularly in view of the improved position of the electric railways.

The progress in decreasing defaults has been continuous since 1922, when the total reached $363,714,100. By contrast with this year's figure the decrease is $234,615,700.

The list of defaulted utility bonds is made up chiefly of traction issues.

New Director Elected.—C. Bruce Maiden has recently been elected a director of the Key System Transit Company, Oakland, Cal.

Earnings Hold Up Well.—Operating revenue of the Springfield Street Railway, Springfield, Mass., for the first nine months of 1926 was $2,358,941, or $55,599 less than for the corresponding period of 1925. Net income for 1926 showed a reduction of $53,468 in comparison with the similar nine months' period in 1925. Car-miles traveled showed a reduction of 13,812. Clark V. Wood, president, said that the net earnings of the company, exclusive of depreciation charges, were more than 2.9 times the bond interest requirements.

Would Offer Bonds.—Application for authority to sell $40,000 in 5 per cent first mortgage bonds at not less than 86 per cent of par has been made to the Ohio Public Utilities Commission by the Columbus Interurban Terminal Company. The application was filed by Arthur B. Bland, president, and F. A. Healy, secretary. The purpose is to purchase trackage and add to the facilities of the company's freight terminal in Columbus, Ohio. The Columbus Interurban Terminal Company owns the terminal passenger and freight station in Columbus. It is operated for the convenience of three interurban railways by which it is owned.

Deficit for Four Months Period.—For the four months period ended Oct. 31, 1926, the total revenue from all sources of the Interborough Rapid Transit Company, New York, N. Y., was $18,853,988, a decrease of $656,167 over the corresponding period of last year. Expenditures for operating and maintaining the property increased $589,670. Taxes payable to the city, state and the United States increased $107,300. Rentals and other income deductions increased $30,778. The net result for the four months was a deficit of $1,749,834. This is $1,383,916 greater than the deficit for the corresponding period of last year. The comparison with last

Digitized by Google

year is influenced by the strike during the month of July of this year, as well as the fact that in July of last year there was a lump sum payment of $770,000 on account of the new advertising contract, against which there was no similar payment this year.

November—A Good Month in Seattle.—Street railway revenue on the lines of the Seattle Municipal Railway, Seattle, Wash., has averaged $80 a day more during November than it did on corresponding days of 1925, according to D. W. Henderson, superintendent. The receipts for every other month of the year have been less than those of the corresponding months of last year, with the biggest loss in February, when the fares averaged $839 a day less than in February, 1925.

Net Corporate Income Lower.—For the four months ended Oct. 31, 1926, the passenger revenue of the Brooklyn City Railroad, Brooklyn, N. Y., was $3,734,156, against $3,748,041 for a similar period of last year. Operating expenses and taxes increased from $3,212,962, to $3,231,197 for the four months ending Oct. 31, 1926. After the consideration of income deductions, there was a net corporate income of $401,492 for the four months period of 1926, against $446,915 for the four months period ended Oct. 31, 1925.

Authorizes Car Line Sale.—The Public Service Commission has recently granted the joint application of the City & Suburban Railway of Washington and the Washington Railway & Electric Company permitting the sale by the former company of all its state property rights and franchises within Prince Georges County to the Washington Railway & Electric Company. The stock of the suburban has been owned and controlled for some time by the Washington company. The order is just the official turning over of all the physical assets to the parent company.

Revenue Lower in October, 1926.—For October, 1926, the revenue of the Boston Elevated Railway, Boston, Mass., exceeded the cost of service by $2,723, against $117,704 for a similar month in 1925. The average fare for revenue passenger was 9.263 cents, against 9.279 cents. The number of revenue passengers carried was 31,423,943, against 31,890,185 for October, 1925. Total miles operated equaled 4,901,082, against 4,699,174 in October, 1925. This included motor bus mileage of 455,376, against 275,511 in October of the year previous.

Taxes for Assessments Announced.—The assessed valuations of all classes of property in St. Louis, Mo., total $1,292,357,285 for the 1926 taxes, according to an announcement of the State Tax Commission. This is an increase of $65,188,085 over the 1925 assessments. It is 26.7 per cent of the grand total of $4,835,000,000 for the entire state. Under the distributable property law of the state the $47,144,102 assessment of the United Railways, was apportioned at $38,645,780 to the city and $8,408,322 to St. Louis County. This assessment does not include land, buildings, supplies and other items assessed locally, but represents only property returned to the State Tax Commission.

Legal Notes

GEORGIA. — *Ordinance Which Requires Jitney Operators to Furnish Liability Bonds to City Is Legal.*

The regulation and control of jitney bus traffic comes clearly within the powers of a municipality. Hence an ordinance requiring the operators of such buses to furnish to the city a bond for the protection of persons injured, is the exercise of ordinary and necessary means of regulating such traffic, and the right of the city to sue on such a bond is a necessary consequence. [Transylvania Casualty Insurance Co. vs. City of Atlanta, 134 Southeast. Rep., 632.]

GEORGIA.—*Passenger Projecting Elbow Out of Window Not Negligent.*

It is not negligent per se for a passenger upon a street car to sit with his arm protruding not more than two or three inches out of the window on the side adjoining the parallel track, even though there may be horizontal bars at the window to suggest to the passenger the danger of this practice. Whether such conduct is negligent in certain circumstances is a question of fact for the jury. [Georgia Railway & Power Co. vs. Ogletree, 134 Southeast-Rep., 830.]

ILLINOIS. — *Value of Land Injured by Transmission Line*

Where a strip of land was condemned for an electric transmission line, the burden of proof of damages to land outside the strip was on the land owner. Such value should be on the basis of the most profitable use for which the land was available at the time, but "availability" refers only to present capacity for use, as may be anticipated with reasonable certainty and made the basis of intelligent estimates. [Illinois P. & L. Co. vs. Parks et al, 153 Northeast. Rep., 483.]

KENTUCKY. — *Passenger Falls After Stepping on Pebble in Street While Alighting.*

A street railway company is not responsible to passengers for injuries resulting from defects or obstructions in the street, except so far as they are in the part of the street which the railway is obliged to keep in repair or where a conductor knows or should know of obstructions or other danger at a point where passengers alight. The company is not liable if a passenger leaving a car steps on a pebble or other small rolling object on a smooth concrete pavement and falls. [Kentucky T & T Co. vs. Soper, 286 Southwest. Rep., 776.]

MASSACHUSETTS—*Discretion of Trustees in Withholding Dividends Upheld.*

The Eastern Massachusetts Street Railway Company was authorized under a special act of the legislature which directed the governor to appoint five trustees to operate the property for a certain term. After a number of years of such operation a suit in equity was brought against the trustees by certain stockholders to compel the payment of dividends on the common and adjustment shares and reduce the amount being expended for depreciation and rehabilitation. The court held that expenditures necessary to keep the capital intact are operating expenses and are to be paid before dividends are paid, and that the discretion of the trustees as exercised in this matter could not be said to be unreasonable or in violation of law. [Adams vs. Eastern Massachusetts Street Railway et al, 153 Northeast. Rep., 466.]

NEW JERSEY.—*City Council Has Large Discretion in Regulation of Buses.*

A city council has large discretion in controlling and regulating the business of motor buses operating on public streets for the convenience of the traveling public. An ordinance granting such a bus franchise, accompanied by an elaborate schedule providing for the time that buses must enter and leave the city, is therefore legal. [Dryer vs. City Council of Union City, 134 Atlantic Rep., 624.]

NEW YORK. — *Car Has Right of Way Over Pedestrians Between Street Intersections.*

An automobile driver stopped his car in the middle of a block to make some deliveries and was struck by a trolley car while he was crossing on foot to the left-hand side of the street between two street intersections. He was held to be negligent as a matter of law, as the rights of a person attempting such a crossing are subordinate to the rights of a trolley car. [Neuman vs. Union Railway, 243 New York Supp., 249.]

NEW YORK.—*Action by Public Service Commission Without Its Jurisdiction Is Void.*

The Public Service Commission granted a bus franchise without notice to a parallel electric railway whose service would be affected, as required by law. In such circumstances, the Supreme Court declared the certificate of convenience and necessity granted to the bus line to be null and void. [Hudson Valley Railway vs. United Transportation Co., 217 New York Supp., 614.]

NEW YORK. — *"Fair Value for Rate Making" of a Utility.*

A fair value for rate making of a utility is not necessarily reproduction cost less depreciation, as such a rule in times of price deflation might work a hardship on the utility and in times of price inflation might give the utility more than a reasonable return on its property. A fair value for rate making is one which will enable the utility to realize the expense of operating and keeping up its road and meeting its financial obligations from investments with a reasonable excess for dividends and contingencies. Anything below a fair return is confiscatory and anything above it is exorbitant and oppressive. [City of Rochester vs. New York State Railway, 217 New York Supp., 452.]

Digitized by Google

NEW YORK—*Care Required at Plazas.*

A pedestrian crossing a plaza not at a regular street crossing is not a trespasser. Hence, as a matter of law, a motorman is not excused when he suddenly doubles his speed at such places and injures a pedestrian. [Hinz v. Eighth Railroad, 152 Northeast. Rep., 475.]

OHIO.—*Partial Satisfaction Received from One Responsible Party Does Not Release Other.*

A city and a railway were sued successively for injuries by a passenger who stepped from the car into a hole in the street. They were held not to be joint tort-feasors because the city's liability was based on its failure to keep the street in repair and the company's liability came from stopping the car at a dangerous place for passengers to alight without warning them. Hence, partial satisfaction received by judgment from the city did not relieve the company from a later suit. [Poehl vs. Cincinnati T. Co., 151 Northeast. Rep., 806.]

OHIO — *Contract with Union — Withdrawal from Arbitration.*

"Contracts by which an employer agrees to employ only union labor are contrary to public policy when they take in an entire industry of any considerable proportion in a community so that they operate generally in that community to prevent or seriously deter craftsmen from working at their crafts or workmen from obtaining employment under favorable conditions without joining a union. Either party in common law arbitration may withdraw therefrom at any time before the award was actually made. The award of arbitrators made under a contract which is against public policy cannot be enforced. Where there is legal fraud in the selection of the key arbitrator, the award is not binding. [Polk et al. vs. the Cleveland Railway, 151 Northeast, Rep., 808.]

PENNSYLVANIA.—*Car Trust Securities Held Taxable Under State Law.*

A section of a state law provides that "all script, bonds, certificates and evidences of indebtedness issued***or ***assumed, or on which interest shall be paid by any and every private corporation***are hereby made taxable for state purposes." Certain car trust certificates were held taxable by the State, although another section of the law indicated that certain other car trusts were not so taxable. [Commonwealth vs. Philadelphia R. T. Co., 134 Atlantic Rep., 455.]

RHODE ISLAND — *Trolley Car Strikes Automobile in Rear*

An automobile on the track just ahead of a street car waited at a street intersection for the traffic signal. After the signal had been given, both car and automobile started, but the automobile stopped suddenly to avoid another automobile which looked as if it were about to cross. A rear end collision from the trolley car behind ensued. The court held that the duty of the automobile driver to give timely notice to the vehicle behind and the negligence of the motorman in the circumstances, were questions for the jury. [O'Donnell vs. United Electric Railways, 134 Atlantic Rep., 642.]

Personal Items

New Vice-President of Accounts in Philadelphia

John F. Schmunk, a certified public accountant with offices in Harrisburg, Pa., has been appointed vice-president in charge of accounts of Mitten Management, Inc., operators of the Philadelphia Rapid Transit Company, Philadelphia, Pa. Associated with the bureau of accounts and statistics of the Public Service Commission under Coleman Joyce, the first chief of the bureau, Mr. Schmunk started business in Harrisburg in a partnership with Mr. Joyce, when the latter left the commission. Later Mr. Joyce left to become affiliated with Mitten Management and recently he was made assistant to Thomas E. Mitten, the head of the corporation. Mr. Schmunk was engaged at various times by the company in accounting and recently he assisted in valuing the property owned by the Philadelphia Rapid Transit in the case before the Public Service Commission over an increase in fares.

Charles E. Chalmers, receiver of the Second Avenue Railroad, New York City, N. Y., has been elected president of the National Bank of Yorkville, which opened for business on Dec. 1 at Lexington Avenue and 85th Street. He will continue his duties as receiver of the railway property. The Second Avenue Railroad has been one of the hardest hit in New York. Mr. Chalmers has worked strenuously to improve the property physically and has succeeded to an unusual degree in rehabilitating it, considering the handicap under which he labored. He was one of the first traction managers in New York to recognize the possibilities of the one-man car and he rebuilt practically all the rolling stock of the company for such service. The work carried out by him has been described from time to time in the ELECTRIC RAILWAY JOURNAL. It reflects great credit on him for his acumen in authorizing the undertaking and on the staff for carrying the changes through so successfully.

W. R. Morrison returned on Nov. 8 to the operating department of the Illinois Power & Light Corporation as division manager of the Quincy division. Mr. Morrison formerly was in charge of the operation of the Wichita Railroad & Light property for twelve years and later was transferred to the engineering department at Peoria, in which position he had charge of general construction work, including the new plants at Jacksonville and Champaign, Ill.

Obituary

V. R. Powell

Transportation held a peculiar fascination for the late Virgil R. Powell, manager of the Peoples Railway, Dayton, Ohio, brief mention of whose death was made in the ELECTRIC RAILWAY JOURNAL for Nov. 13. He was progressive and anxious that his line should give the best of service. Lately he had come more and more to the conclusion that the progress he desired was impossible until increased fares were authorized. It was his plan to educate the public into an appreciation of the service rendered and of the inability of a corporation to render good service unless it had the money wherewith to go ahead. On this subject he prepared a number of addresses which he delivered before civic organizations.

Years ago it would have surprised no one more than Virgil Powell himself to know that some day he was to be general manager of an electric railway property. At the age of eighteen he was a country school teacher. This calling was followed until he entered the electric railway field, presumably for a time only. The step was taken to provide him with funds to complete his classical education. Once within the railway arena, he saw the problems which the industry offered at that time, but he also saw the possibilities ahead and made up his mind to remain in that service.

During his early years of association as conductor on the Peoples Railway he completed a course in electrical engineering. That was the beginning of constant application to the various positions of timekeeper, office manager in the track and overhead line construction department, storekeeper, inspector, assistant superintendent of transportation, superintendent, claim adjuster in the operating department, and finally general manager in 1924, replacing W. E. Boileau. In his service at Dayton there was one interruption, however, in April, 1904, when he was transferred to the Chicago & Joliet Electric Railway, another subsidiary of the American Electric Power Company. Here he served as assistant superintendent of transportation. Two years later he returned to Dayton to assume the position of superintendent and claim adjuster of the Peoples Railway, filling the vacancy caused by the death of Michael Kelly, superintendent.

Mr. Powell was born in Mechanicsburg, Ohio, in 1879. He received his education at public schools there and also attended Ohio Northern University at Ada. Mr. Powell was a member of the Dayton Chamber of Commerce and was active in civic, fraternal and social affairs of Dayton.

Col. William G. Dows, president of the Iowa Railway & Light Company, Cedar Rapids, Iowa, died on Nov. 25 in the University of Iowa Hospital at Iowa City. He was one of the best known utility men in the state. Mr. Dows was 62 years old. He retired from active participation in the railway business in 1919, when he was succeeded by his son as general manager of the Iowa Railway & Light Company. In addition to his utility experience he was prominent in financial and political affairs throughout the state.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions
A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

Seattle Car Order Still Under Consideration

The proposal to buy 80 new lightweight cars for the Seattle Municipal Railway, Seattle, Wash., has not been abandoned. This fact was disclosed when a conference for the near future was arranged with members of the City Council, Board of Public Works and Mayor Landes to decide whether an effort would be made to carry through the deal. An item of $1,400,000 was provided in a railway utility bond issue several months ago for the new cars and the Board of Public Works favored an award of the contract to the St. Louis Car Company, but when the company sought certain definite assurances under the terms of the contract the matter was put over indefinitely.

New Equipment in Virginia

The Virginia Electric & Power Company, Richmond, Va., will shortly award a contract for ten 44-passenger street cars of double-truck de luxe type. The company has placed an order for 21 21-passenger buses and has contracted for ten additional 29-passenger buses. The new equipment will cost approximately $300,000.

Aluminum Car Placed in Operation by Cleveland Railway

The Cleveland Railway's aluminum car, partially completed for the exhibit at the October convention of the American Electric Railway Association, is about to be placed in regular service. The car was assembled in the Harvard shops of the Cleveland Railway. It is the first of its kind to be constructed.

Practically the same design and construction were followed as embodied in the latest steel type used by this company. Aluminum and aluminum alloys were substituted under the direction of engineers of the Aluminum Company of America, with a consequent weight saving of approximately 6 tons.

There are several alloys used in different parts of the truck and body assembly, depending upon the nature of the strength required. These alloys are often known as duralumin. One of the common alloys said to have nearly the same strength as steel contains an admixture of 4.5 per cent copper, 0.75 per cent magnesium and 1 per cent manganese.

The side frames of the trucks were pressed into shape by the J. G. Brill Company with the same equipment used in forging steel side frames. The standard structural shapes used are manufactured by the extension process rather than by the rolling process to which resort is had in manufacturing steel shapes.

Practically all truck parts and equipment, except wheels, axles, motors, gears and electrical equipment, are built of aluminum.

All body parts are aluminum or alloy except doors and glazing. Bucket type seats are used and all seats face forward.

It is expected that the reduction in the weight of the car will effect a saving of 15 per cent in power.

100 New Cars for Massachusetts Cities

Tentative Rehabilitation Plans for Springfield and Worcester Call for Large Expenditures

At a recent meeting of the board of directors of the New York, New Haven & Hartford Railroad tentative plans for the rehabilitation of the Springfield Street Railway, Springfield, Mass., and the Worcester Consolidated Street Railway, Worcester, Mass., were formally approved and Vice-President E. G. Buckland was authorized to draw up agreements co-operatively with the City Council of each city.

The Springfield plan for rehabilitation in its tentative stages provides for the purchase of 50 trolley cars, double tracking in Summer Avenue and Belmont Avenue, a loop through Taylor Street and the substitution of buses on the Worthington Street line. These are parts of the plan to be taken care of first and probably followed by lesser improvements. The new cars to be purchased will be of a lighter type than the present double-truck two-man cars. They will have a 50-passenger capacity and will be arranged so they may be easily operated by one man or two men as desired. The estimated cost of the 50 cars is placed at $700,000.

The plans for rehabilitation of the Worcester Consolidated Street Railway system also provide for the tentative purchase of 50 new cars, to cost $700,000. This is out of a total of $1,000,000, which it is believed will cover immediate requirements of the system. The balance of $300,000 will go for the purchase and laying of new rails.

George Dwight Pratt, a member of the board of directors of the New Haven road, stated that the plan as approved was in keeping with the original promises held out by officials of the New Haven road when they sought to reacquire control over the street railway companies. Details of the rehabilitation had not yet been fully worked out, as a great deal depended on what the cities intended to do for the future improvement of the streets through which car lines run. He added that as soon as the City Councils approved the final plan agreed upon the New Haven road would proceed with the work.

The New York, New Haven & Hartford Railroad is not expected to place any requisitions for cars or rails until the control of the two companies by the New Haven has been certified by the Public Utilities Commission.

$700,000 a Year for Improvements in Ottawa

Ottawa, the seat of the government of Canada, is a city of about 125,000. It has 54 miles of electric railway, operated by the Ottawa Electric Railway. By comparison with cities of the first magnitude, Ottawa does not rank so very high, but the company there has been doing big things with its electric railway to keep it up to par or a little better. Thus in the last three years more than $2,000,000 has been spent on the modernization of the railway. New cars and motor coaches and track extensions into new districts account for the major part of this sum. A power station on Albert Street, another on Holland Avenue, work shops on Elm Street, a new home for the line department, a garage and many other similar items have been added to the plant.

The new car shops on Elm Street and Champagne Avenue were erected at a cost of $250,000. They cover nearly 100,000 sq.ft. of ground and embody the best features and latest mechanical devices of the most modern shops. They are designed to meet the requirements, not of today only, but of many far-off tomorrows.

Additions to power plant include two new substations, one on Albert Street and one on Holland Avenue, and 3 miles of conduit, which saved the erection of many unsightly poles.

A modern garage has been erected on Albert Street, for the fleet of O.E.R. motor coaches. This garage is up to date, being fitted with motor-driven ventilators to combat the deadly exhaust gases.

A considerable portion of the expenditure is being devoted to renewal of tracks. The north track on Sparks Street was relaid last summer. Rails weighing 122 lb. to the yard have taken the place of the 90-lb. steel laid there in 1912. It is probable that the south track on Sparks Street will be replaced with the new type rail next year.

A new home for the line department and two new "trouble trucks," minimizing delays in the service when emergent repairs are needed; the installation of the Hull Loop and station, making possible the use of double-truck cars on the St. Patrick Street line; the reorganization of the overhead structure, the construction of dams at the Chaudière, the replacement in many places of ungainly cedar poles by artistic iron uprights—here a dollar, there a hundred thousand—are among the many features of the future program.

San Francisco Expenditure for Cars $250,000

Current reports make it appear that the Board of Public Works of San Francisco, Cal., is all set to award to the St. Louis Car Company, St. Louis, Mo., the contract for the construction of fifteen car bodies for the Municipal Railway. The reported price at which

Digitized by Google

the work will be let is $9,634 for each body. The matter of the purchase of these cars has been agitated for a long while. Only a few weeks ago the Board of Public Works approved an appropriation of $100,000 to purchase trucks and motors intended for use under these cars. The combined expenditure totals $250,000, or something less than $16,000 a car complete.

Improvements in Cars Operated Between Rochester and Syracuse

Transformation of the present interurban trolley cars operated between Rochester and Syracuse, N. Y., by the Rochester & Syracuse Railroad into up-to-date chair cars will take place about Dec. 15. The present double seats will be taken out and chairs upholstered in leather and mohair will be substituted. The present windows and wooden sash will be supplanted by 40-in. steel sash set in steel frames, giving passengers a better view of the scenery along the route.

Motor and Equipment Prices Reduced

Announcement has been made by the General Electric Company that prices on railway motors and car equipments have been reduced approximately 5 per cent, effective from Dec. 1. This reduction is the result of greater economies due to a consolidation of all railway manufacturing and engineering at the Erie, Pa., plant of the company.

According to the policy of the General Electric Company, when economies in engineering or manufacturing are effected, they are reflected in the prices of the electrical product to the operating companies.

A reduction in prices on its general-purpose motors, amounting to 5 per cent on most lines and 10 per cent on commonly used sizes of squirrel-cage induction motors, has also been made effective since Dec. 1. The motors affected by the new price levels include both alternating-current and direct-current constant and variable-speed general-purpose motors, from 1 hp. to 200 hp. Prices of standard squirrel-cage induction motors have now been brought to a level within about 10 per cent of that in 1914.

Coincident with this reduction in prices the company has announced a unified schedule of discounts for different classes of purchasers. The discount for quantity purchased at one time, on one firm order, has been made uniform on a sliding schedule for all classes of buyers. The company states that these reductions have been made possible by improved manufacturing processes and quantity production.

Swiss Electric Locomotives for Spain

In competition with German, British, American, French and other Swiss concerns the Oerlikon Maschinenfabrik of Oerlikon, has just secured a contract for the supply of 22 heavy electric locomotives for use on the electrified section of the North of Spain Railroads.

The mechanical portion of the engine is to be built in Spain by the Compania Euskalduna de Construccion y Reparacion de Buques, Bilbao. The system being adopted on the lines is the same as the neighboring French railroads, i.e., continuous current with a pressure at overhead conductor having a normal value of 1,500 volts and variable between 1,100 and 1,800 volts. The locomotives are to be capable of hauling a maximum weight of 1,200 tons, excluding the weight of locomotive. The maximum speed is 56 m.p.h. The engines will be carried by two six-wheel bogies and provided at either end with driver's cab.

The high and low-tension gears are arranged in the center of the locomotive, while two passages insure communication between the two driver's cabs. Each of the six axles will be driven by a separate motor, the torque being transmitted through reduction gear with a ratio of 1:4.94. The three motors of each bogie will be connected in series, so that the pressure applied to the motors individually will amount to 500 volts.

Adelaide Will Have 22 Additional Garfords

Seven Garford Model CB double-deck buses are in daily operation by the South Australian Railways on the streets of Adelaide, Australia. The company has found these units to be very satisfactory for its own operating requirements, and accordingly has placed an order with the Garford Motor Truck Company for 22 additional units of similar design. The first seven were placed in service early this year.

The buses, one of which is shown above, operate over what is known as the Adelaide-Glenelg route, covering a distance of 17 miles per round trip. They are operated from 6 a.m. until midnight, and a total of 204 miles a day is averaged by each bus. Fifty-eight seated passengers may be accommodated.

The body, built by the South Australian Railways, is mounted on Garford Model CB chassis, which is powered with the large type Z Wisconsin six-cylinder engine, rated at 48.6 hp. S.A.E., and capable of developing 105 hp. The chassis is equipped with four wheel air brakes and dual pneumatic tires in the rear. Its wheelbase is 220 in.

Exports of Electric Railway Equipment Are Listed

Interesting monthly figures on the exports of railway motors, electric locomotives, starting and controlling equipment for electric railways and vehicle motors, railway signals, switches and attachments are now being prepared by the bureau of foreign and domestic commerce of the United

States Department of Commerce. The figures are listed by countries and in the cases of motors and locomotives the quantities as well as the costs are given. The statistics shown in the table on page 1031 are for the month of September, 1926.

Important Bearing Data Assembled

The new Timken Engineering Journal, a loose-leaf book of 110 pages, contains technical information relative to the application of Timken bearings to automotive and industrial machinery. A number of pages are devoted to the explanation of the Timken bearing as manufactured at the present time. Exclusive features such as the positive alignment of the rolls, one-piece precision cage and special alloy steel are explained. Typical problems, with the solutions, involving the calculation of various loads and the selection of suitable bearings are given. Tables showing bearing ratings, capacities and dimensions as well as speed capacity curves are included.

Methods of mounting Timken bearings, shaft and housing design, adjustment of Timken bearings, closures, cup and cone fitting practices, assembly methods and lubrication are treated in separate chapters. A full set of dimension sheets accurately drawn to scale, together with formulas and recommendations for the application of Timken bearings, developed through experience gained in successfully applying more than 150,000,000 bearings, comprise another section.

Galena Signal Oil Officers Resign

Changes are announced in the personnel of the Galena Signal Oil Company, New York. L. J. Drake, president; George A. Barnes, vice-president, and J. C. Tipton, manager of the foreign department, have all withdrawn from the company, Mr. Drake after 25 years of service, Mr. Barnes after 30 years and Mr. Tipton after 20 years. Their resignations went into effect on Nov. 1. It is not expected that permanent officers to succeed them will be elected until early in the new year. All of the retiring officials are well known in the electric railway field, in supplying which with lubricants the company long specialized.

Metal, Coal and Material Prices

	Nov. 30, 1926
Metals—New York	
Copper, electrolytic, cents per lb.	13.375
Copper wire, cents per lb.	15.875
Lead, cents per lb.	8.00
Zinc, cents per lb.	7.46
Tin, Straits, cents per lb.	71.625
Bituminous coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$7.00

Turpentine (bbl. lots), N. Y., per gal.	$0.89

Rolling Stock

Hamilton Street Railway, Hamilton, Ont., Canada, through its owner, the Dominion Power & Transmission Company, has awarded a contract to the National Steel Car Company, Hamilton, for 24 new cars to cost $480,000.

Ottawa Electric Railway, Ottawa, Canada, has included in its program of expenditures for the future the purchase of two new "trouble trucks."

Muncipal Railway of St. Petersburg, St. Petersburg, Fla., received on Nov. 1 the eight cars ordered on May 17, 1926. Specifications on this equipment, referred to in the ELECTRIC RAILWAY JOURNAL, issue of May 22, page 910, are as follows:

Builder of car body	Brill
Type of car	One-man double-truck pass.
Seating capacity	46
Weights:	
Car body	13,700 lb.
Trucks	10,500 lb.
Equipment	6,250 lb.
Total	30,450 lb.
Bolster centers, length	17 ft. 10 in.
Length over all	40 ft. 1 in.
Truck wheelbase	5 ft. 1½ in.
Width over all	8 ft. 5 in.
Height, rail to trolley base	11 ft. 6 in.
Body	Steel
Interior trim	Mahogany
Headlining	Agasote
Roof	Arch
Air brakes	Westinghouse
Armature bearings	Sleeve
Axles	4-in.
Bumpers	5-in. channels
Car signal system	Faraday
Car trimmings	Aluminum
Center and side bearings	Brill
Conduits and junction boxes	Brill
Control	K-35
Couplers	Brill
Curtain fixtures	Curtain Supply Company
Curtain material	Pantasote
Destination signs	Hunter
Door-operating mechanism	National Pneumatic
Fare boxes	Johnson
Finish	Color and varnish system
Fenders or wheelguards	H-B
Gears and pinions	Helical, four cars; spur, four cars
Hand brakes	Brill
Heater equipment	None
Headlights	Golden Glow
Journal bearings	Brill
Journal boxes	Brill
Lightning arresters	K-3, four cars; MD-3, four cars
Motors	Westinghouse 506, four cars; GE-264, four cars; all inside hung
Safety car devices	Safety Car Devices Company
Sash fixtures	Brill, all metal
Seats	Brill Winner 201-A
Seating material	Brown leather
Slack adjuster	Sauvage
Springs	Brill
Step treads	Kass
Trolley catchers	Earll
Trolley base	Nuttall 20-A
Trolley wheels	Ideal
Trucks	Brill 77-E1
Ventilators	Brill
Wheels	Cast chilled, 26-in.
Special devices	Fiest door hinges; Westinghouse Traction Brake Co. C-6 feed valve

Trade Notes

Electric Controller & Manufacturing Company, Cleveland, Ohio, announces the appointment of the Farr Electric Service, Inc., 228 W. South Temple, Salt Lake City, Utah, as it representative.

Silver Lake Company, Newtonville, Mass., which has been manufacturing braided cords in its plant since 1858, has organized a subsidiary plant at Chattahoochee, Ga. This new plant will occupy about 65,000 sq ft. of floor space and will produce such grades of sash cord as can be manufactured most economically in that section. The preparation processes are to be manufactured by the Whittier Mills Company, which has recently completed a plant for this special purpose. The two plants are under the same management. All sales will continue to be made, as in the past, from the general offices of the Silver Lake Company at Newtonville.

New Advertising Literature

American Strombos Company, Inc., Philadelphia, Pa., has published bulletin No. 82, describing the Strombos air signal for locomotives, motor and electric cars. The signal may also be used in yards and in signal towers.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., will gladly send copies of folder 4712, which illustrates and describes various important features of the company's exhibit at the A.E.R.A. convention in Cleveland. This eight-page folder covers the latest apparatus developments of the industry.

Carnegie Steel Company, Pittsburgh, Pa., has issued a new booklet entitled "Wrought Steel Wheels and Other Circular Sections—Forged Steel Axles." The design and specifications contained in this catalog have been completely revised and brought up to date.

General Electric Company, Schenectady, N. Y., has issued "Silent Gears," a publication of 28 pages devoted to its Fabroil and Textolite products, manufactured by it solely for the purpose of making silent gears. They differ only in the method of fabrication and not in basic materials. The company says that the history of the development of these silent gears goes back to 1908, when John Miller, chief millwright of the Schenectady Works of the General Electric Company, being aware of the necessity for such a gear, started a long series of experiments to find a material that would prove suitable. His work along these lines resulted in a radically new type of gear, which from the first proved highly successful, and which was the prototype of the modern fabroil gear.

Sanford Mills, Sanford, Me., has issued a booklet describing the use of Chase Velmo mohair velvet for bus upholstery. Velmo upholstery has been in use in railroad service over a long period of years. It has now been adopted for bus upholstery as well.

Morton Manufacturing Company, Chicago, Ill., announces that during the early days of January, 1927, it will receive for distribution a new catalog covering all of the items included in the Acme line of railway appliances and industrial steel products. Mr. Morton states that every attention has been given to the preparation of this book calculated to make it as comprehensive as possible, consistent with simplicity of form and intelligent presentation and description of the products which it represents. Those desiring copies of the new catalog should communicate with the Morton representative in their district or direct with the general offices at Chicago.

Transit and Traffic Solution Demands Broadened Viewpoint

IN THE larger cities of the world, and particularly in the United States, the traffic and transportation pot continues to boil and seethe. In London the suggestion is made in the reports of the Ministry of Transport's Advisory Committee, abstracted elsewhere in this issue, that there be set up a common management and a common fund to which all forms of passenger transport, including underground and surface railways and buses, would be parties. The board of management would be made responsible to an over-riding authority who would settle questions of community policy, determine the facilities required, control fare matters and exercise financial as well as physical supervision. Under this plan the governing motive would be the co-ordination of all facilities, so that each form of transport would perform the functions to which it is best adapted. Although no definite suggestions regarding a plan for their inclusion in such a co-ordinated system are made, the part played by the suburban service of the four main line railways entering London is mentioned. The entire proposal is based upon the premise that with proper co-ordination of facilities there is in London sufficient traffic to provide an adequate return on such a pooled investment, and also to make possible continuous improvement to meet the growing needs of the community.

Developments in New York show evidence of a growing appreciation on the part of thinking business men and the press that overlapping and competition of transportation agencies are not in the best interests of the city. There is apparent a unanimity of opinion among merchants and property owners in favor of less politics and more common sense in dealing with the complicated technical, economic and financial problems of transportation and street congestion. There is a growing sentiment against the fetish of the 5-cent fare at any cost in safety, convenience and comfort. A form of quasi-public corporation is being mentioned as a means of pooling present resources so as to bring order out of the present chaos. One or two city officials are beginning to call a halt on the orgy of reckless dissipation of the city's financial resources in ill-advised subway construction entirely independent of existing facilities. Quotation of huge deficits in the public press is beginning to make the people of the city realize the magnitude of the debt being piled up against posterity in meeting transit losses incurred in trying to make riders think they can buy a 10-cent ride for 5 cents.

Likewise in St. Louis the solution of the transportation situation seems to depend on a popular realization of the fundamental necessity of co-ordinating all existing facilities. No orderly and economical program of development can be undertaken until that is brought about. Utilization of existing surface cars is recommended as the backbone of a transportation system for the city; putting them underground in the most congested district, and extending such costly work only as the growth of the city demands.

Thus in these several important cities, and in many others as well, there is a tendency to apply common sense to the transportation problem in place of hysteria and suspicion. Through lack of general understanding of fundamentals and because of inertia and lack of interest on the part of the public at large these vital matters have in the past been left in the hands of selfish politicians. The traffic hodgepodge threatens to halt civic development by converting the avenues of commerce and communication into helpless tangles of humanity and machines. Though these came together in the modern city to facilitate the progress of business and industry, they are being rendered impotent through sheer confusion and interference the one with the other.

That co-ordination of the several facilities of travel offers the only sane means of bringing some degree of order and economy out of the present hopeless confusion and waste is beginning to become evident to those business men and property owners whose attention has been directed to the seriousness of the present situation by the increasing difficulty of doing business in the congested districts of modern cities. There is likewise a growing realization, though it is yet largely in intangible form, that solution of the bewildering complexities of the situation produced by the movement of passengers and commodities in city streets depends on a broadened approach to the problem.

Although there is no definite program proposed for considering freight movement along with passenger transportation, the mention of the suburban traffic of the London railroads in connection with other forms of local transit is significant. Likewise, the similarity of the suggestions in London and New York for pooling all transportation interests is thought provoking. There exists now in New York, in the form of the Port of New York Authority, a body with ample power to approach the freight problem from the standpoint of the community as a whole. But here again there is consideration of only one of several elements. An adequate solution of traffic congestion and transit requires simultaneous consideration of both freight and passenger movement throughout a city and its tributary area. This must be approached with a view to the present and future needs of the community as a whole, rather than of any particular section or any one agency. Only then can a real community transit plan be devised, and only then will basic improvement and sound progress be possible.

Supreme Court Throws Further Light on Proper Basis for Utility Values

IF COSTS of construction did not fluctuate it would be a comparatively easy matter to determine the value for rate-making purposes of a public utility property. The basis for such value, though subject to certain modifications for depreciation, going value and other conditions, has been determined judicially to be cost of reproduction. But with fluctuating costs it becomes obviously an important matter to determine the date at which the reproduction is assumed. This has been especially true in recent years because of the great changes in construction costs since 1914. Hence this latter question has become of serious moment in the determination of utility valuation, namely, should properties or parts of properties erected when building was cheaper or more expensive be valued at the cost at that time or those which are in force at present?

Still another question in valuation, even more important than the one just asked, is: What effect on the value of a utility property will be caused by future changes in the units of construction cost?

The importance of the latter question is that valuations of utility property are undertaken usually not to determine the justice of past rates but the reasonableness of those in the future or early future. If the principle is adopted that present costs are to be used to determine future rates, it would seem only logical to have any new rates based on property values continue only so long as construction costs remain practically stationary. In other words, with value based on "cost of *present* reconstruction, new, less depreciation," a material rise or fall in construction costs should be followed by a corresponding revision of rates.

This, briefly, is the position taken in the majority opinion by the United States Supreme Court in the case of the Indianapolis Water Company decided Nov. 29. The court's rule of ascertaining present value is given in the following sentences:

> If the tendency or trend of prices is not definitely upward or downward and it does not appear probable that there will be a substantial change of prices, then the present value of land plus the present cost of constructing the plant, less depreciation, if any, is a fair measure of the value of the physical elements of the property. The validity of the rates in question depends upon property value Jan. 1, 1924, and for a reasonable time following. While the values of such properties do not vary with frequent minor fluctuations in the prices of material and labor required to produce them, they are affected by and generally follow the relatively permanent levels and trends of such prices.

This seems to settle definitely and for all time the determination of the date to which prices of construction are to be referred. It is the present date, not that of the time of construction, or a ten-year average, or cost figures determined on any other basis. But in the part of the decision just quoted the court goes further than simply to define present value. It speaks of "a reasonable time," "fluctuations in the prices of material and labor," future values and future rates. These points are elaborated further on in the decision where the court declares:

> In the light of all the circumstances, there must be an honest and intelligent forecast as to probable price and wage levels during a reasonable period in the immediate future. In every confiscation case the future as well as the present must be regarded.

In the case at issue, that of the Indianapolis Water Company, the court held:

> There is nothing in the record to indicate that the prices prevailing at the effective date of the rate order were likely to decline within a reasonable time, one, two or three years, to the level of the average in the ten years ending in 1923, and we may take judicial notice of the fact that there has been no substantial general decline in the prices of labor and material since that time. The trend has been upward, rather than downward.

The decision has many other interesting declarations which help to establish valuation law, such as the discussion of rate of return, not less than 7 per cent being considered justified in the case; on going value, for which 9.5 per cent was allowed; on the means for determining depreciation, which should be actual, not assumed, and on a number of other points. But to revert to the question of date of valuation, it is worth while to consider briefly the practical effect on construction policies of the application of this principle rather than the establishment for all time of a value based on prices as of a certain date, whether the time of construction, 1914, or the present.

The effect should be beneficial to both public and utility. The owner of private property who erects a building has to consider future trends in prices. He is penalized if he builds at a time of high prices and profits if he builds at a time of low prices, and he has to consider possible obsolescence and depreciation in the structure he is erecting. The same circumspection will have to be followed by utility operators in the future, whether they approve of this principle or not. The utility owners will be the only ones to suffer if they make mistakes in judgment by building at the most expensive times. But they will gain if they build at times of low construction costs, because in future rate hearings on the basis of present reproduction cost their property will prove more valuable than its actual cost at the time of erection.

The court also indicates its opinion of the frequency with which these rehearings on rates may be necessary. They are required only when there are relatively permanent changes in price levels and trends. As this is to be the law of the future, utilities will do well to keep their records of construction costs in such form as most easily to show the amounts and kinds of materials and labor used. In such a valuation inventory unit costs of any particular day can easily be applied to give the required value for rate-making purposes.

New Twin City Garage a Mark of Good Transportation Service

ONE of the differences between bus service properly co-ordinated and the type of operation that marked the early history of this vehicle is illustrated by the recently completed bus station at Minneapolis. In this city and its twin, St. Paul, the bus first made its appearance more than ten years ago. There existed also in these two cities one of the finest electric railway systems in the country, which reached its full development years ago under the able leadership of Thomas Lowry and Calvin Goodrich. Because of the notable success of this company, creating a demand for transportation, the jitney and bus found fertile fields for competitive operation. Eventually the company accepted the bus as a necessary part of the transportation systems and undertook to co-ordinate its service with that of the railway.

With the completion of the garage and bus station, concerning which a story was published in the issue of Dec. 4, the bus has obtained a sound footing in the Twin City transportation system. The bus as an operat-

Digitized by Google

ing unit has found a permanent home. This new station is more than a garage for storing vehicles during idle hours, it is more than a place to make repairs—it is a business home for the operating personnel as well. The men have locker rooms, well-equipped lavatories and showers, tables on which to count cash, fill out reports, study time-tables and perform such necessary functions. The buses too will not merely be repaired but they will be inspected and overhauled on predetermined schedules to avoid repair as far as possible, and with the same degree of supervision that has attended car operation.

Minneapolis furnishes only one recent example of what co-ordination means. Cincinnati, Philadelphia, Kansas City, Baltimore, Cleveland, Youngstown, Atlanta and many other cities are accomplishing much the same thing. It is the work behind the scenes, so to speak, that establishes that element of difference between the superficial and the sound, the transient and the permanent, the parasite and the servant.

American Business Entitled to Federal Tax Relief

THE announcement of a surplus from federal taxes, which promises to amount to as much as $400,000,000, has precipitated a flood of suggestions as to how to dispose of it. President Coolidge originally urged a flat rebate on this year's income tax payments, but later seconded Secretary Mellon's suggestion of a credit on the tax payments due next March. The Chamber of Commerce of the United States recommends the reduction of the corporation tax and the elimination of the estate tax and the taxes on particular businesses. Representative Garner estimates that by giving the corporations a reduction of $200,000,000, prices to the consumers will be reduced as much as $600,000,000! Representative Hull says that the tariff should first be reduced. Senator Watson favors using the surplus to pay off debt.

With more than nineteen billions of Liberty Bonds outstanding, there seems to be little occasion to seek far afield for a suitable use for $400,000,000. But apparently Senator Watson's conservative proposal will not receive the consideration its wisdom deserves, and somebody's taxes are going to be reduced. When the discussion reaches this point, American industry and business should insist upon a hearing. The time has come when the country ought to be asked to make up its mind deliberately whether it desires and intends that taxes on business shall form a permanent part of the federal financial system.

The most acute situation is that relating to the income tax on corporations. They now pay $13.50 on every $100 of profit. A stockholder, when he receives what is left of that $100 as a dividend ($86.50), may, at the most, take a credit of 5 per cent or $4.33. In other words, a dollar of business profit, earned by a concern doing business under the corporate form and distributed as a dividend, must pay a special tax of something more than 9 per cent. A dollar of business profit earned under the partnership or individual form of organization does not pay this 9 per cent. In other words, our present heavy federal business tax is restricted to corporations.

Why should there be a special federal tax on business profits as distinguished from other types of income? If there should be such a business tax, why confine it to corporations? Should it not be as broad as business itself? These questions are momentous ones for American business and they deserve careful consideration. England, faced with them, decided that she could not afford to impose a special business tax on corporate profits, despite her pressing need for revenue. The case against business taxation is a strong one and deserves careful consideration and co-operative action on the part of every industry in the country. Electric railways are particularly aware of the evils which grow out of the tendency to dig into private pockets indirectly for tax revenue by appealing to the popular expedient of using the corporation as a tax collector. This is bad enough in competitive business, where the tax enters into the price of the commodity. Although it is obviously unfair and unsound thus to penalize the corporate enterprise in favor of the partnership or private business, this tendency to load taxes on corporations becomes even more severe when the business is a regulated utility, in which the price of the product is subject to regulation and does not fluctuate smoothly in accordance with the rise and fall of the cost of doing business. It is obvious that every industrial association in the country should get back of the move to reduce the tax on corporations and that the joint committee on internal revenue taxation, established by the revenue act of 1926, should be devoting itself to an analysis of this problem and the formulation of a wise policy.

Passing the Buck Will Not Solve Paving Problem

BY CHANGING from a rail transportation system to a trackless transportation system the Keighley Corporation Tramways, in England, escaped from a heavy burden of track and paving expense. Unfortunately, however, other expenditures were so greatly increased that the net result of the first year's operation was a considerable loss, while the last full year of tramway operation showed a moderate profit.

Adherents of the new system point out that the increased expenditures were largely the result of giving more service and that tramway operating costs probably would have risen had that system been continued. However, analysis of operating expenses per vehicle-mile does not support these contentions. In the way account substantial savings were made because paving costs were paid by general taxation instead of car fares. Elsewhere the savings attributable to the change from rail to railless transportation were negligible. As might have been expected, replacement of old vehicles by new ones reduced equipment maintenance costs somewhat. Conducting transportation costs fell slightly because of an increase in speed from 6.62 m.p.h. to 6.96 m.p.h. It is not unreasonable to suppose that a similar increase could have been made without difficulty by the tramways. General and miscellaneous expenditures remained the same. Power expense went up. The total cost of operation, including the paving charges carried by the municipality, probably was higher than it would have been if the tramway had been modernized.

By a process of reasoning similar to that by which the trackless trolley adherents in Keighley seek to justify their change in transportation service, some people in the United States find reasons for scrapping the street railways. But those who believe that something has been saved, when in reality money has merely been taken out of one pocket and put into another, are living in a fool's paradise. The way to solve the paving problem is to face it squarely. Sidestepping the issue only makes matters worse.

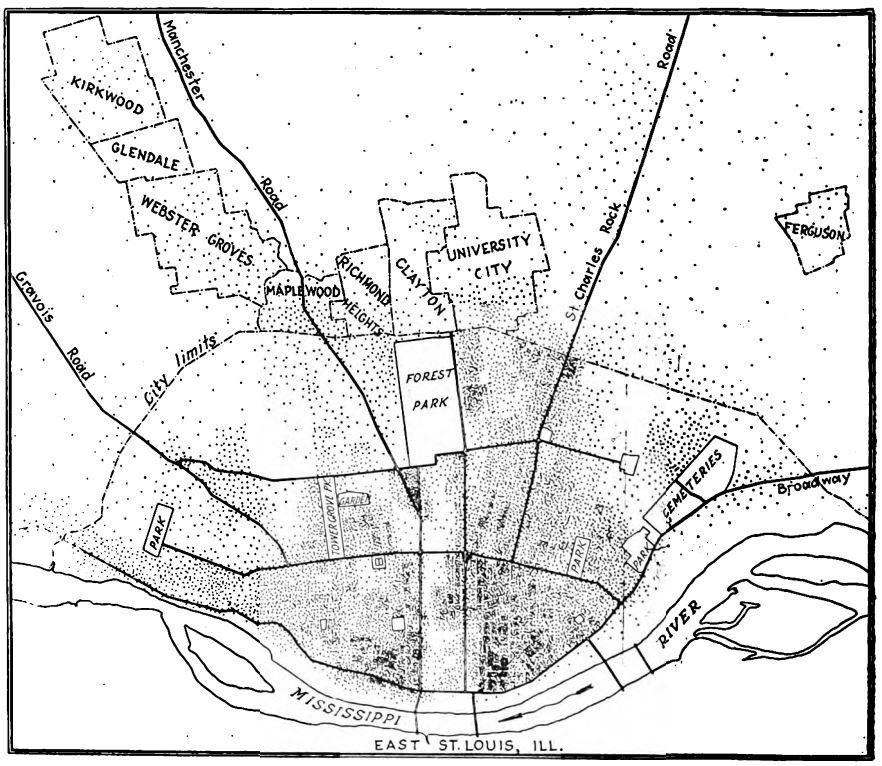
Co-ordinated Transportation Proposed for St. Louis

FIRST ARTICLE

Municipal Committee Declares Mass Transportation Must Continue to Be Provided by Electric Cars, Supplemented by Motor Buses and Rapid Transit Lines—Surface Car Subways Recommended for Downtown Area, Designed so as to Be Capable of Rapid Transit Use Later—Motor Buses Should Serve as Feeders—Present Facilities and Trends of Travel Outlined

LOCAL transportation in St. Louis is the subject of a report presented to the Board of Aldermen of that city on Sept. 24, 1926. It was compiled under the direction of the special rapid transit committee of the board by E. R. Kinsey, president Board of Public Service, and C. E. Smith, St. Louis, consulting engineer of the board. The report, which has just become available in printed form, occupies 338 printed pages, practically the same size as those of this journal, and replete with diagrams, maps and other illustrations. The report was authorized by the Board of Aldermen in October, 1924, following considerable public discussion. During its investigation the committee visited Philadelphia, New York, Boston, Chicago and Detroit.



Distribution of Population in St. Louis in 1925. Each Dot Represents 100 People

THE PROBLEMS TREATED

The report points out that although city transportation and traffic problems have always been important, they have taken on a new significance by reason of the tremendous increase in the use of automobiles and the resulting spreading out of cities within the last ten or fifteen years. Traffic congestion came on suddenly with the automobile and will continue in varying degrees, depending on the success of relief measures. Street railway officials and citizens require education to make them realize that the provision of adequate transportation in large cities is a civic problem. Originally only a convenience, it is now one of the necessities.

The importance of planning transportation in city development is indicated by the results that have followed the neglect of such planning in the past. Electric cars are carrying passengers at speeds ranging from 4 to 40 m.p.h., the different speeds being due in large measure to the environment and different relations between the tracks and other lines of traffic. Present intolerably slow speeds may be increased by intelligent and persistent planning.

Failure of old-established electric railway lines to serve the public completely has led to the development of other and competitive agencies of transportation that have impaired the service given by the street railway. A good deal of this might have been avoided in the past and can be minimized in the future by intelligent planning.

Street car riders have been the worst sufferers from the increasing use of the automobile because (a) the normal increase in street railway business has been interrupted; (b) accidents and costs of operation have increased; (c) service has slowed down, and as the automobile has educated the people to higher speeds, they have become less tolerant of the speed of street cars, and (d) there is a popular idea that the street car should be got out of the way of other traffic and that it should be superseded by other means of transit.

Each year the street railways of the country establish new records for passengers carried, showing that despite the automobile and motor bus, which will supplement but not supersede them, street cars are here to stay and must be provided for. City transportation for the great masses of people must continue to be provided by electric cars, supplemented by motor buses and rapid transit lines.

In a city of 1,000,000 people, with prospects of 1,500,000 in the near future, the relation of means of transit to growth of the city is basic. The growth of

Digitized by Google

St. Louis reached the point some time ago where mass transportation facilities must be improved. Rapid transit facilities were provided in other large cities, even before the congestion caused by automobiles, and for the better movement of the people, as shown in Table I.

TABLE I—DATES OF INTRODUCTION OF RAPID TRANSIT IN DIFFERENT CITIES.

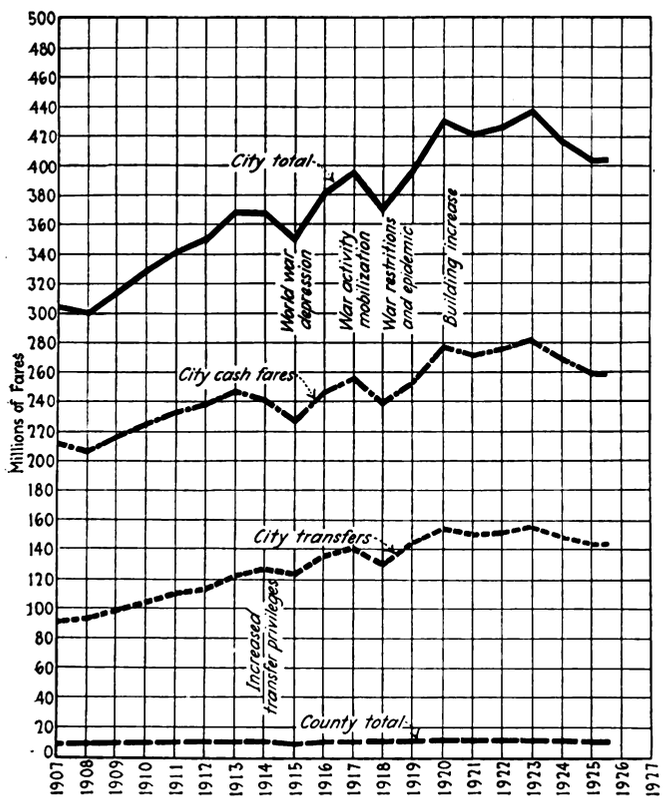
	Year	Population
New York City	1870	1,000,000
Chicago	1890	1,000,000
Boston	1893	500,000
Philadelphia	1907	1,400,000

It is evident that, by comparison, St. Louis has been ready for rapid transit for some time. Some of the advantages of rapid transit lines are:

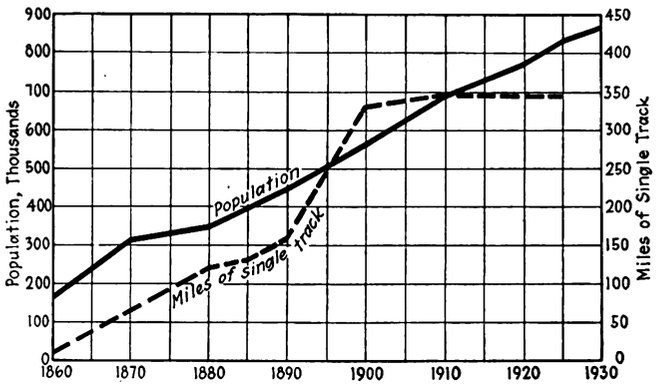
Relief from surface congestion and delay.
Increased capacity of streets for automobiles.
Increased safety on streets by removal of street cars.
Saving of time.
Outlying areas made accessible for homes.
Quickest, cheapest, most convenient form of transportation.
Street railway and bus lines relieved of long-haul traffic.
Cost of moving passengers in trains is less than in single units.
Removes crowding from street cars and permits them to give a seat to every passenger for short-haul and intermediate business.

Except in the congested business center, the stations should be not closer than ½ mile apart; if adequate local surface transportation is provided, the stations should preferably be 1 mile apart. In the congested districts of heavy loading and unloading stations should not be more than ¼ mile apart to avoid too great concentration of passengers at stations.

The first step in rapid transit will be subways for street cars exclusively in the congested districts. In the second step, rapid transit trains will be operated



Total Passengers Carried by the United Railways, All City and County Lines, 1907 to Date



Street Railway Mileage and Population Within the City Limits, St. Louis, 1860 to Date

with some of the downtown subways extending out about half way through the city. Street cars will continue to operate between outlying and rapid transit lines and downtown to serve intermediate areas and to provide local service in the rapid transit area. Motor buses will also serve as feeders and to give local service in areas not settled densely enough to justify street railway lines, also to quite an extent for surface travel in the downtown subway area from which all car tracks will be removed. Traffic on the heavy street car lines can be expedited materially by running cars express between the business center and the points where the heaviest loading and unloading take place, the intermediate district to be served by buses.

CONDITIONS DIFFERENT FROM THOSE IN NEW YORK AND CHICAGO

Conditions in New York and Chicago, calling for long through rapid transit routes, are not so comparable with conditions in St. Louis as are the conditions in Philadelphia and Boston. Boston has already done what has been recommended for Philadelphia; that is, first provide downtown subways in which surface cars may operate and which, when extended far enough out, can be used for the operation of rapid transit trains. There is much in the Boston plan that can be adapted to St. Louis. The difficulty experienced at Philadelphia by not having an operating agreement in advance of construction, which was avoided in Boston and New York by prior contracts, can be avoided also in St. Louis by having definite arrangements made prior to the construction.

Downtown subways will have a tendency to stabilize business in its present location by making it easier to get around there, and will thus encourage its growth in an orderly way in all directions from the present business center.

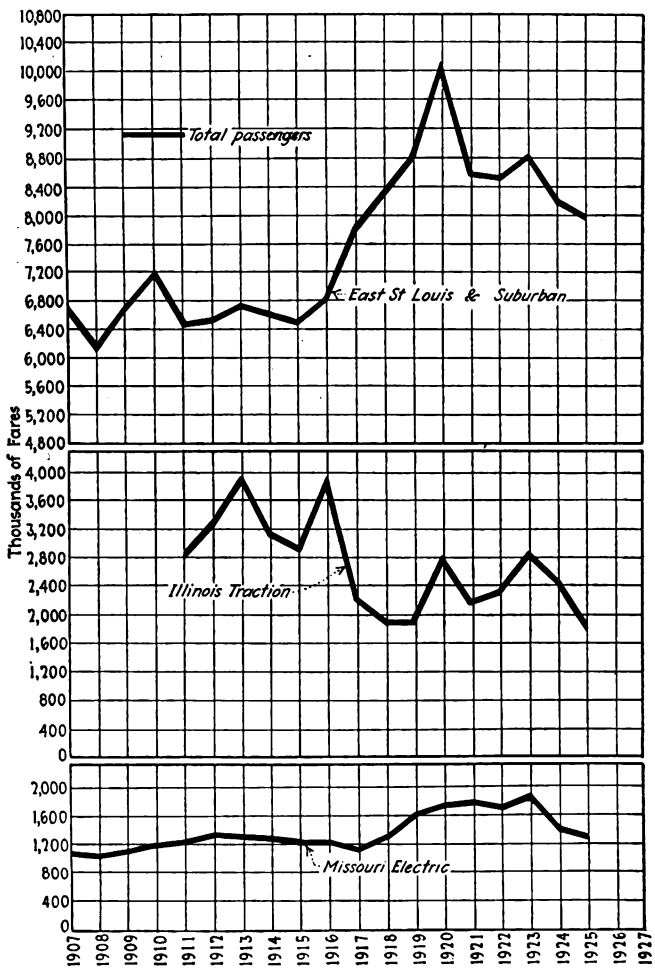
The operating expenses per passenger-mile on rapid transit lines, when properly supplied with passengers, is much less than on street railway and bus lines, and great economy can be effected by transferring passengers to and from the rapid transit lines, instead of hauling them long distances on street cars and buses. Long-distance street car riders are carried at a loss.

Duplication in transportation facilities and service is wasteful. Transportation can be furnished better and cheaper by a single transportation agency than by more than one. This single transportation agency should be planned to perform satisfactorily all the transportation that is needed of the classes desired by its patrons at the lowest fare.

St. Louis is certain to increase in population, as it

Digitized by Google

has an ideal combination of the chief factors for manufacturing and distribution. It is nearer the centers of agriculture, population, land area, mineral and timber production in the United States than any other large industrial city. Most of these centers are within a radius of 300 miles, and the wheat center and the cotton center of the country are only slightly beyond the 300-mile circle. St. Louis has an excellent climate and admits of open-air work more days in the year than any other large industrial city. It has waterway barge service to the Mississippi Valley and Gulf ports. It has lower taxes than any other large city. It is close to large supplies of cheap fuel and electric power. It has



Total Passengers Carried by Interurban Lines Entering St. Louis, 1907 to Date

great diversification in its industries, not more than 8 per cent of its labor being employed in any one line. It is served by more railroad lines than any other large city except Chicago.

The distribution of its 1,000,000 population in 1925 is shown graphically in an accompanying chart. The present average population density is now fifteen to the acre.

History of Transportation in St. Louis

The first attempt at mass transportation in St. Louis was an omnibus line started in 1843. By 1858 there were ten omnibus lines in operation; the headway on the busy lines was four minutes. The year 1859 saw the organization of ten horse car companies. By 1875 nearly all the settled districts in St. Louis were served by horse car lines, most of them competitive.

The first cable railway line was built in 1886. This was followed by other cable lines, which gradually were electrified. By 1899 all the lines, with one exception (the St. Louis & Suburban), were consolidated into one company, and in 1907 this outside company was included in the present system. The united company now has 247 miles of single track, ranking with other large cities of the country as shown in Table II.

TABLE II—ELECTRIC RAILWAY MILEAGE IN SEVEN LARGE U. S. CITIES, 1925

City	Population Served by Railways	Miles of Single Track	Feet of Single Track Per Inhabitant
Chicago (*a*) (*b*)	2,940,000	1278	2.29
Boston (*a*)	1,221,000	513	2.22
St. Louis (*b*)	831,800	347	2.20
Pittsburgh	1,580,000	592	2.08
Cleveland	1,094,000	425	2.04
Detroit	1,200,000	383	1.68
Philadelphia (*a*)	1,940,000	588	1.60

(*a*) Includes rapid transit mileage.
(*b*) Figures are for city only.

At the time of the consolidation, in 1907, free transfers were established between any line and any other. In 1914 the universal transfer system was inaugurated so that a rider might go on a street car from any part of the city to any other part for one fare, using three or four lines, if necessary.

No Extensions for More than Twenty Years

In 1904 the track mileage of St. Louis was large for the population of the city, but from that date the company has made practically no extensions. An accompanying diagram shows the increase in population and street railway mileage in various years. The lack of growth in mileage since 1900 is very striking. There was a constantly growing demand for extensions of the street railway lines, but the railway would not accede to them. In 1917 the city of St. Louis appeared before the Public Service Commission of Missouri and asked that the United Railways be made to extend its lines into undeveloped territories, and the commission ordered several miles of extensions. The company appealed to the Missouri Supreme Court, which ruled that it could not be compelled to build and operate them because it was not so obligated by its franchise. The company's apathy toward making extensions was due in the main to its financial difficulties since the consolidation.

The consolidated system was so badly overcapitalized in 1899 that by 1904 it was financially embarrassed by the necessity of refunding underlying mortgages. Some of the investment in horse car lines, and especially the heavy investment in the cable car lines and operating machinery, had been carried along into the capitalization of the electric car lines. From 1904 to 1919 the company used all its surplus above fixed charges to pay off maturing mortgages and to pay for necessary improvements, which were kept to the minimum.

The financial difficulties due to the 5-cent fare, combined with the loss in business and the increase in expenses, were offset in part by raising the rate of fare from 5 cents to 6 cents in 1918, then to 8 cents in 1919, and then back to the present fare of 7 cents in 1920. There has been no financial embarrassment due to insufficient earnings, as the company has consistently earned a comfortable margin for depreciation and surplus above interest on bonds, although capital requirements and poor credit due to overcapitalization made it necessary to reinvest in the property surplus earnings that otherwise might have been available for dividends.

Digitized by Google

People continued to locate beyond the ends of street car lines, particularly in the southwest and northwest sections, confident that the company would ultimately extend out to them, but as the years passed a gradually increasing resentment against the company made it easier for the Peoples Motorbus Company to secure privileges to operate motor buses in competition with the electric cars.

When the receiver took over the system, it was hoped he would extend the lines, but he soon announced his inability to do anything. After the Peoples Motorbus Company became an established competitor, however, the reorganization committee of the company organized the St. Louis Bus Company, to give extension service to the street railways that the receiver could not give.

Long Hauls to Business District

Another source of dissatisfaction with the street railway system was due to conditions beyond the control of the company. St. Louis is roughly elliptical in shape. The primary business district is at one side of the city, close to the Mississippi River. The city limits are roughly 6 to 7 miles distant from the primary business district, north, west and south. Thus the average hauls are longer and the people have to spend more time on the cars than in a city where the primary business district is approximately central. This time is lengthened by the concentration in narrow business streets downtown of automobile, pedestrian and street car traffic, and this congestion is accentuated in the evening by a short peak period of about 30 minutes. This makes it absolutely impossible for the company to supply enough cars during that short period comfortably to carry the passengers. Many people are willing to pay a higher fare on the competitive motor buses. For various reasons, St. Louisans have moved prematurely from delightful high-level residence districts near the center of the city to districts farther out. This has further increased the difficulty of the street railway.

As most of the radial lines are 6 to 7 miles long, and crosstown lines much longer, and as there is comparatively little short distance riding, the St. Louis street car system has never suffered much from jitney competition, although with the longer time per trip of the cars much traffic has been lost to automobiles.

It is generally conceded, states the report, that properly to serve the primary business districts the present street surface must be given over to individual transit and that collective transit must be carried on at separated levels, either above or below present streets.

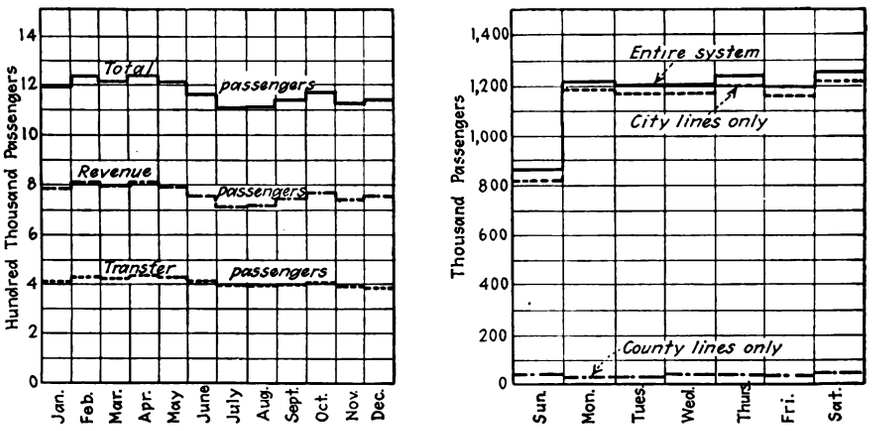
City Transportation Agencies

The companies now performing local and suburban transportation in and around St. Louis are:

1. United Railways of St. Louis.—This company operates the street railways in St. Louis and St. Louis County and the interurban line of the Missouri Electric Railroad, running from Wellston to St. Charles. Since April 12, 1919, the United Railways has been in the hands of a federal receiver, but it will shortly be reorganized as the St. Louis Public Service Company. The United Railways handles about 270,000,000 cash fares per year and about half that number of transfer passengers. This comprises about 90 per cent of the total urban traffic, the other 10 per cent being carried by the Peoples Motorbus Company.

At the end of the year 1925 the United Railways owned 347.3 miles of single track in the city and 115.6 miles in the county, making a total of 462.9 miles of single track. It owns and operates a total of 1,608 passenger cars, of which 1,429 are motor cars and 179 are trailers. Of this number 201 cars are light-weight cars of the Peter Witt type, seating 60 passengers each. The physical property of the company is in good condition. The track is well built and is maintained in fine condition. The rolling stock, though some of the cars are very old, is clean, well painted and fairly well lighted.

The receiver claims that the company has not been making a proper return on its property value and operated during 1925 at a loss. In May, 1926, he applied to the Missouri Public Service Commission for an increase in fare.



At Left, Passengers Per Month During 1925, Daily Average. At Right, Average Daily Passengers Per Week During May, 1925, United Railways of St. Louis

2. Missouri Electric Railroad.—This company is owned outright by the United Railways, though retaining its corporate entity and operating as a different company. It owns 23.4 miles of single track and eleven double-truck cars. A zone fare is in effect, there being three zones and a bridge toll to St. Charles. For the past two or three years the company has been subjected to severe competition by independent motor bus operators. During 1925 the company lowered fares in an effort to bring back some of its passengers and then installed non-stop de luxe bus service between the two terminals. This increase in service and the reduced fare has finally won back the traffic and the independent buses have gone out of business.

3. St. Louis Bus Company.—This company was organized by the reorganization committee for the United Railways to give extension service to the street railways. It operates single-deck buses in certain sections of the city and county that were in need of better transportation service. It gives and receives transfers from the street car lines and most of the rides are extension rides. The bus fare is 10 cents, of which the United Railways gets 7 cents whenever a transfer is made, the bus company receiving only 3 cents for a transfer passenger. This company began operation on Nov. 9, 1924, and operates 35 single-deck buses on eight lines over 30 miles of route.

4. Peoples Motorbus Company.—This company began

Digitized by Google

operations in St. Louis on May 28, 1923. It is a direct competitor to the United Railways and operates over many miles of streets having car tracks. It carried in 1925 about 23,800,000 revenue passengers, less than 10 per cent of the total riders. The fare is 10 cents with limited transfer privileges between bus lines, but no transfers to street cars. It began operation with seventeen buses. In 1924 this number was increased to 120 double-deck buses and 53 single-deck buses. The buses now operate twelve lines over 70 miles of route.

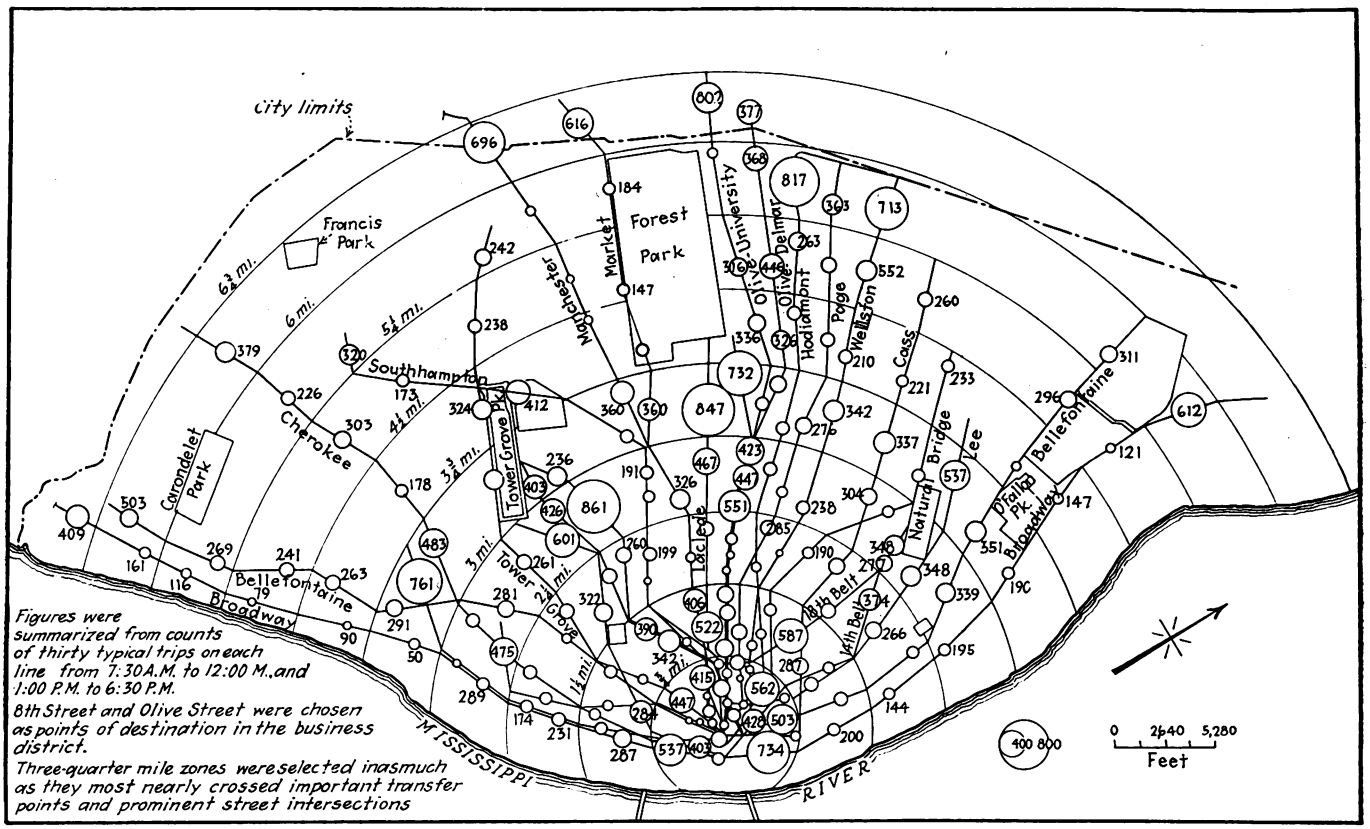
INTERURBAN ELECTRIC RAILWAYS

The territory surrounding St. Louis has been so well supplied by steam railroads that there has been comparatively little interurban electric railway development. Five electric lines extend west from the city limits, that cross the river on bridges into downtown St. Louis. Their track gage is 4 ft. 8½ in., while the United Railways' tracks are 4 ft. 10 in. gage. This precludes the possibility of through operation, which would be undesirable otherwise because of different riding characteristics. These roads are:

1. East St. Louis, Columbia & Waterloo Railway.—This company operates a line south from East St. Louis to an undeveloped railroad and industrial district of Columbia and Waterloo Hill, 25 miles from St. Louis.

2. East St. Louis & Suburban Railway.—This company operates the city street railway system in East St. Louis and interurban lines to Belleville and Edwardsville.

3. Alton, Granite & St. Louis Traction Company.—This company is allied with the East St. Louis & Suburban Railway and operates lines to Edwardsville and Alton.



Relative Proportions of the Volumes of Travel Originating in Different Parts of the City Are Shown by the Number and Size of the Various Circles. Traffic as of January, 1920

more in the nature of suburban than interurban lines, as follows:

Ferguson, 11 miles from downtown St. Louis, with a 5-mile branch to Florissant.

St. Charles, 20 miles from downtown St. Louis.

Creve Cœur, 17 miles from downtown St. Louis.

Kirkwood, 15 miles from downtown St. Louis.

Meramec Highlands, 18 miles from downtown St. Louis.

The three first lines operate principally on private rights-of-way beyond the city limits and are capable of being developed as rapid transit lines by separating the crossings. The fourth and fifth lines practically parallel and serve the same territory as the Missouri Pacific Railroad.

INTERURBAN ROADS ON EAST SIDE OF THE RIVER

On the east side of the river, in Illinois, there are four companies operating interurban electric railways

The three companies in East St. Louis operate their cars across the Mississippi River on the upper or highway deck of the Eads Bridge, in and out of the terminal of the St. Louis end of the bridge. When the steam railroad trains are transferred to the St. Louis Municipal Bridge, as proposed, these electric cars may be placed on the railroad tracks of the Eads bridge and operated at high speed on the lower deck free from all other traffic.

4. Illinois Traction System.—This company operates an interurban line from its terminal in St. Louis through 2½ miles of St. Louis streets to the McKinley Bridge, then across the Mississippi River through the streets of Venice, Madison and Granite City and over private right-of-way to Springfield and Peoria, 172 miles from St. Louis. This is the only long interurban line out of St. Louis. Its allied company, the St. Louis Electric

Digitized by Google

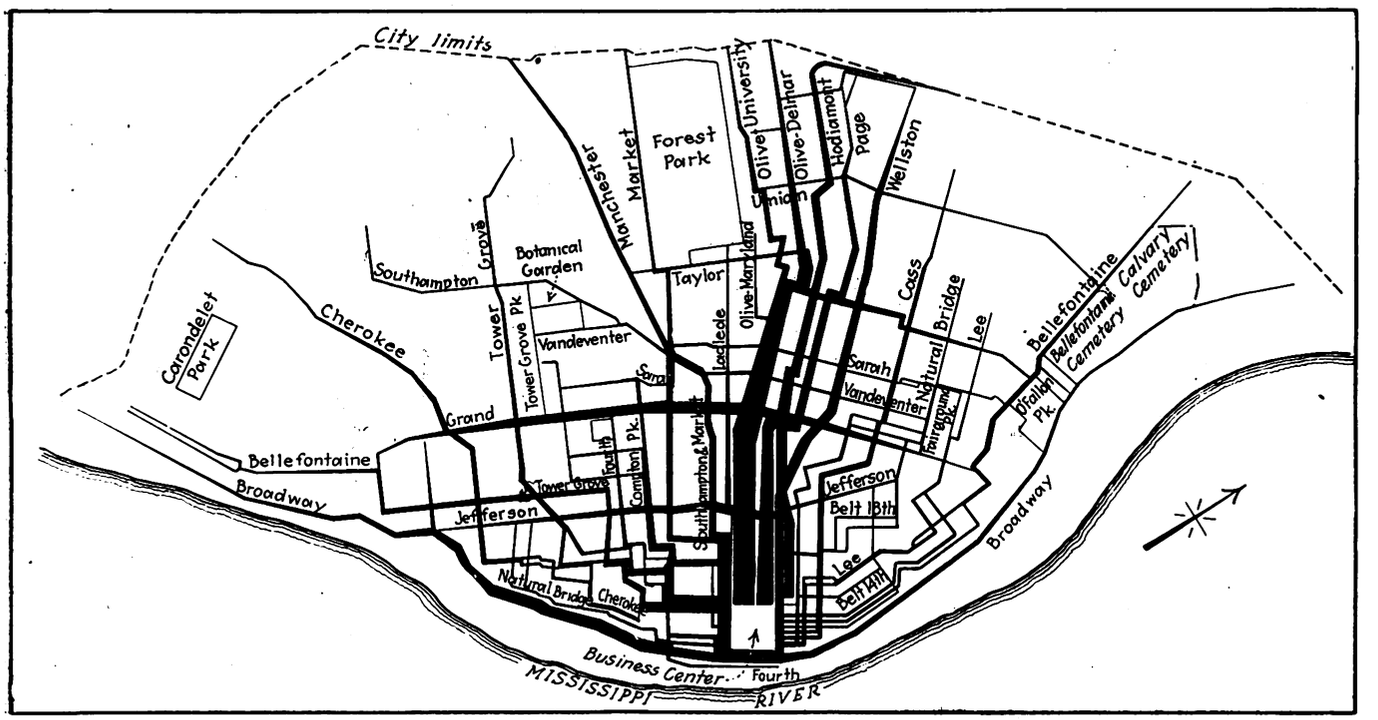
Terminal Railway, handles local business between the St. Louis terminal and Granite City. High-speed service is given by the traction system on its private right-of-way, but it is seriously slowed down in the city streets, especially St. Louis. It is making arrangements to detour its cars over private right-of-way around Venice, Madison and Granite City.

Suburban Railroad Service

Three steam railroads furnish suburban service from St. Louis, namely, Wabash Railroad, Missouri Pacific Railroad and St. Louis-San Francisco Railroad. The first does not use any depot, but loads and unloads in the open on the river front adjoining the business district. The two last mentioned use the Union station, about a mile from the business district.

Suburban Motor Buses

Motor buses are being operated on practically every road radiating from St. Louis. All are being operated into the downtown district and thus adding to the congestion. These buses should be compelled to provide bus terminals to avoid delaying traffic while loading and unloading in the streets. In future, when rapid transit routes extend out beyond the congested district, these bus lines should terminate at the outer end of the rapid transit lines and assemble and distribute passengers with those points as termini.



Daily Flow of Traffic on Lines of the United Railways. The Lack of Direct Transit Facilities to the Northern and Southern Sections of the City Is Quite Apparent

Trend of Street Ralway Travel

Two accompanying charts show the number of passengers carried on the city lines and on the interurban lines, so far as the figures on the interurbans relate to total number of passengers handled in and out of St. Louis. It will be noted that the trans-river electric railway traffic amounts to only about 5 per cent of the revenue passengers in St. Louis. This must be kept in mind when facilities are provided for trans-river traffic in St. Louis.

It will be noted that 1920 was the banner year in the history of transportation in St. Louis. Traffic from 1921 to 1923 continued approximately at the 1920 rate, but did not show the increase that should have been expected because there was a concurrent increase in the number and use of automobiles that apparently absorbed the increased travel due to the growth of the city. In 1924 motor bus competition began on a comprehensive scale. The decrease in street car riding from 1923 to 1924 was about the same as the amount of bus traffic. The increase in the number of bus passengers in 1925 was accompanied by a further decrease in the street car riding. In 1926 the traffic carried by the United Railways is on the increase.

A comparison of the riding on city lines, as just discussed, and on the interurban lines shows somewhat different characteristics. The decrease in riding in 1915 and 1917 as shown on the city lines was felt less in the country because the patrons of these lines are for the most part salaried business and professional people whose work is not directly affected by business depression. The "break" or decrease in riding occurred in 1923, a year earlier than on the city lines. This is due to the greater use of the private automobile by the country dweller to go to and from his work.

Local Transportation Characteristics

The next series of charts, four in number, relates to the character of riding on the lines of the United Railways of St. Louis. The first of these shows the origin of passengers on the lines entering the business district, the relative proportions of the volume of travel originating in different parts of the city being shown by the size of the various circles. The second diagram shows the travel over the different lines by the width of the lines. As will be seen, the greatest volume of travel is westward from the business district. The Olive Street line, the most heavily traveled line in the city, is represented by the widest line in the approximate center of

Digitized by Google

the map. The Page, Hodiamont and Wellston lines are also easily distinguishable. The lack of direct streets which would afford direct transfer facilities to the northern and southern sections of the city is also quite apparent.

The two charts on page 1039 show the monthly and weekly distribution of travel. The monthly variation chart is compiled from 1925 figures and is based on the average passengers per day during the month, so that the variations caused by the different lengths of months disappear. It will be noted that there is not very much variation in this curve, especially during the first five months. July and August show some decrease as compared with the rest of the year. The weekly chart is based on the average for the days in question during May, 1925. This curve is also fairly flat, showing that the number of passengers is almost the same, irrespective of the day of the week, except on Sundays.

Hourly counts by lines show that on business days one-third of the passengers daily enter the central business district between 6 a.m. and 10 p.m. and that one-third of the people who do so leave the same district on the street car within one hour.

The afternoon rush period is characterized by a short, sharp peak, lasting about 30 minutes, from 5 to 5:30 p.m. During that time the street cars slow down and slow down other traffic by their delay in loading passengers. If means could be devised to spread this traffic evenly over one hour or an hour and a half conditions would be materially improved; all traffic would move faster and better street car service could be given.

The fact that one-third of the total street railway passengers enter the business district shows that it is at this point that the first step in rapid transit construction should take place.

Altogether 553 street cars enter the downtown business district within the maximum 30-minute traffic period, and nearly twice that number of cars enter during the next hour.

Railway Takes Tolls from Automobilists

FOR most interurban lines private automobilists represent a loss of revenue. Even the Illinois Traction System has suffered to some extent from the great increase in automobile traffic which has developed in recent years. But the I.T.S. has discovered one way of getting revenue back from the automobilists. This is by charging tolls for them to cross the McKinley Bridge over the Mississippi River at St. Louis, as explained in the company's 1926 Coffin prize brief.

When the McKinley Bridge, which is the largest electric railway bridge in the world and one of the principal gateways to the St. Louis territory from Illinois, was opened to traffic in 1910 it was not possible to foresee the great increase which was to occur in automobile transportation. Nevertheless, although the bridge was constructed primarily for electric railway service, provision was made for vehicular traffic through wings on both sides of the bridge. These roadways proved popular with automobilists, even though slow-moving freight vehicles and the higher speed passenger automobiles had to use the same roadway.

Somewhat more than a year ago the company decided to provide two roadways, one for the more slowly moving auto trucks and the other for passenger cars. Following out this policy, the company assigned the side roadways to the former traffic and laid a paved highway for passenger automobiles in the center of the bridge. The publicity department of the company then put in effect an extensive advertising campaign, having for its purpose the popularizing of this toll bridge among the drivers of all kinds of vehicles crossing the Mississippi River at St. Louis. This advertising featured the separation of slow and fast traffic and also the fact that the bridge offered a short, desirable route between Illinois and Missouri points.

Altogether 416 painted highway signs were placed within a radius of 75 miles along the paved roadways leading to the bridge. These signs not only carried an advertising message but told the number of miles and direction to St. Louis. These signs are supplemented by a series of red arrow "markers," placed along the main highways and directing the traveler to the McKinley Bridge. Other methods of advertising the route were also followed.

Illinois Traction System Gets a Revenue from Automobilists by Laying a Paved Highway on the McKinley Bridge and Providing Separate Routes for Slow-Moving and Fast-Moving Motor Traffic

While the cumulative effects of these signs and advertising efforts are yet to be realized, the first month following their establishment showed an increase in the earnings of the bridge of 15.6 per cent over the same period the previous year. This increase was apparently wholly attributable to the campaign, since reports for previous months had shown no similar increases.

In Keighley, England, Local Transportation Is Now Furnished by a System of Double-Deck Trackless Trolleys and Single-Deck Gasoline Buses

Paving Burden Shifted by Changing the Type of Transportation

Substitution of Trackless Trolley Operation in Place of Tramway Service in British Industrial Town Reduced Way Maintenance Cost, but Other Expenses Were Increased and First Year Showed Large Deficit

KEIGHLEY, ENGLAND, is a town of approximately 42,000 inhabitants surrounded by a number of smaller municipalities. Two years ago all tramway service was given up and trackless trolley operation inaugurated in its place. This was done partly because the paving obligations had become very burdensome, due to the heavy vehicular traffic, and partly because much of the track was in need of immediate rebuilding. Although partial substitution of trackless trolleys or buses in place of tramways had been made in a number of other places, Keighley was the first city in England to undertake a complete change. Analysis of operating statistics for the first year of the new service shows that maintenance of way costs have been practically eliminated. Other expenses have been somewhat reduced when reckoned on a vehicle-mile basis, but the total annual expenditures were greater than before.

British law requires that tramways shall maintain the paving between the tracks and for 18 in. on each side. On the other hand, services which run without rails have to pay only the national automobile tax.

The Keighley tramway system comprised 6.62 miles of single track, of which about 2.50 miles was in dangerous condition before the substitution was made. To rebuild and pave this trackage would have cost about $145,000, it was estimated. Other sections also were in poor shape and additional expenditures amounting to $10,000 a year for renewals would have been required to restore the property to good condition. Moreover, the cost of track and paving maintenance was about $7,500 per year.

Replacement of tramway rolling stock was an impending need. The cost of twenty new trackless trolleys, and such changes as might be required in the overhead system, was estimated at $187,500. While this sum was somewhat in excess of the immediate expenditures required to continue tramway operation, it was felt that the change would be more economical in the long run. It was decided, therefore, to provide an entirely new system of transportation for the city.

Because the tramway had been one of the largest customers of the municipal electric power station, and because of the existence of a sharp traffic peak at noon as well as between 5 and 6 o'clock in the afternoon, it was thought that trackless trolleys, with their greater carrying capacity, would meet the needs of the situation better than gasoline buses. Double-deck, top-covered vehicles seating 56 passengers each were purchased.

Comparison of results under the old and the new systems shows that fewer passengers are being carried now, although the vehicle mileage has increased. A seven-minute service is at present provided in place of the ten-minute service formerly operated by the tramway. Car-miles have increased from 246,061 per year to 355,916, or more than 40 per cent. Total passengers have decreased from 4,087,718 in 1924, the last

Digitized by Google

full year of operation, to 3,913,147. Passengers per vehicle-mile have fallen from 16.6 to 10.9, and revenue per vehicle-mile has decreased from 40.8 cents to 27.5 cents.

Establishment of competitive bus service is believed to have been responsible for the decrease in traffic. Although the buses do not actually pick up passengers on the trackless trolley routes, they carry many people who might otherwise use the trolleys.

Partly offsetting this loss there has been a considerable reduction in operating expenses per vehicle-mile. Present costs are only about 24.7 cents per car-mile as compared with 30.9 cents for the tramway in 1924. In making these comparisons the year ended March 31, 1924, has been taken for the rail system rather than the following twelve months because maintenance was neglected during the latter period in view of the prospect that the property would be scrapped. Figures for the trackless trolley are for the year ended March 31, 1926.

With the elimination of track and paving maintenance, a material saving has been made in the way and structures account. As was to be expected, equipment maintenance costs were less per vehicle-mile for the new trackless trolleys than they had been for the aged tramcars. Energy consumption decreased slightly per vehicle-mile, but line maintenance costs jumped up, so that the power account remained about the same. Due to higher speed of operation the vehicle-mile cost of conducting transportation was slightly reduced. General and miscellaneous expenses remained about the same. Detailed figures are shown in the accompanying table. British classification of accounts differs somewhat from that usually followed in the United States, but the figures from Keighley are sufficiently detailed to permit allocation of expenses in a manner approximating American practice.

The Double-Deck, Top-Covered Trackless Trolley Operated by the Keighley Corporation Tramway Has Seats for 56 Passengers

COMPARISON OF OPERATIONS

	Tramways	Trackless Trolleys
Passengers carried	4,087,718	3,913,147
Vehicle-miles operated	246,061	355,916
Average fare per passenger, cents	2.40	2.46
Revenue per vehicle-mile, cents	40.84	27.52
Expenses per vehicle-mile, cents	30.87	24.75
Operating ratio, per cent	75.57	90.12
Average passenger per car-mile	16.6	10.9
Average speed, mph	6.62	6.96

TOTAL EXPENSES INCREASED

While the operating expenses per car-mile showed a material reduction for the new system, the total annual expenditures were larger in all accounts except way and structures. This was due to the greatly increased car mileage operated. Total operating expenses were more than $90,000 for the trackless system as compared with approximately $80,000 for the tramway in 1924. To make matters worse the new system had to meet larger payments for interest and depreciation. Coupled with a reduction in gross income, this resulted in the loss of $11,000 as compared with the net revenue of $13,000 for rail operation in 1924.

The large expenditures made in 1926 by the trackless trolleys for interest and depreciation were mostly the

Total	14.620	13.860
General and miscellaneous	2.818	2.828
Total operating expenses	30.868	24.755

result of factors not directly connected with their own operation. Previous to the general change-over, a short trackless trolley line at one time operated in conjunction with the tramways had been replaced by a bus line. Fixed charges for this old line are now paid by the new trackless trolleys, while the revenue of the route is credited to the bus operation, thus placing on the new system a burden which does not properly belong there. Fixed charges for the abandoned tramway system also are carried by the trackless trolleys.

Buses operated by the Keighley Corporation have been comparatively profitable and the revenue derived

FINANCIAL RETURNS FROM OPERATIONS

	Tramways	Trackless Trolleys
Gross earnings	$104,600	$102,000
Operating expenses	79,100	91,700
Gross income	$25,500	$10,300
Interest and depreciation	12,000	21,600
Net income	$13,500	.....
Net deficit	.....	$11,300

from this source has to some extent offset the loss of the trackless trolley undertaking. The remaining deficit is made up from general municipal funds raised by taxation.

Despite the unfavorable financial showing of the first year's operation of the new system, the people of Keighley are well satisfied. It is asserted that the tramway probably would have fared equally badly had its operation been continued, as renewal of track and paving would have necessitated large expenditures. The ability of the trolley bus to approach the curb when taking on and discharging passengers is considered an important factor in its favor. The substantial increase in the amount of service rendered has pleased the public greatly.

Benefits of Eight-Car Trains Seen in Loop

A NEW high record was made by the Chicago Rapid Transit Company, Chicago, Ill., on Oct. 7, 1926, when 989 cars entered the Loop in the hour from 7:30 to 8:30 a.m. This is the greatest number of cars ever put into the Loop in a single hour in the history of the elevated lines.

The increase in seating capacity is due to the eight-car train operation. The number of trains entering the Loop was 180 in the heavy rush hour. Before the installation of eight-car trains the usual number of trains entering the Loop in an hour was about 185, but the maximum number of cars never exceeded 910. The longer trains have made it possible to reduce slightly the number of units and increase the carrying capacity by approximately 80 cars an hour. That means an additional 4,000 seats in an hour. The increased capacity applies in about the same proportion to the evening rush hours.

80 Per Cent of Detroit Shoppers Use Public Transportation

Survey Made by Retail Merchants' Association Shows That 56.7 Per Cent Use Street Cars and 24.2 Per Cent Travel on Buses

DETROIT, the greatest center of automobile manufacturing in the world, relies on street cars to carry 56.7 per cent of its local traffic. Buses transport an additional 24.2 per cent, making a total of 80.9 per cent carried in public transportation vehicles. Private automobiles carry 19.1 per cent. These figures were computed as the result of a three-day survey made Nov. 10-12 by the Retail Merchants' Association. As one part of the city-wide traffic survey mentioned in ELECTRIC RAILWAY JOHRNAL, issue of Dec. 4, page 1020, a check was made at 27 of the largest downtown stores to determine the means of transportation used by customers. At only one store did the users of private automobiles outnumber the users of public transportation vehicles, the automobilists in that case constituting 53 per cent of the total customers.

Nearly 200,000 customers were interviewed. Of this number 110,555 used the street car, 48,251 used the bus, and 36,272 used private automobiles. The percentages for the various stores are given in the following table:

SUMMARY OF TRANSPORTATION MEANS USED BY DETROIT SHOPPERS, IN PER CENT OF TOTAL

Free Parking Spaces Increase Street Car Riding

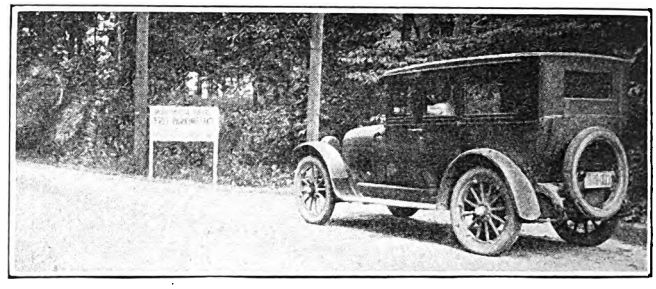
Many Motorists Avoided Congested Traffic During Fair Week by Parking Their Cars and Using Electric Cars of the Grand Rapids Railway to Reach the Fair Grounds

ONE of the big events in Grand Rapids is the West Michigan Fair, which is held there every fall. The fair grounds are located north of the city and one of the principal routes for motorists in reaching them is by way of Monroe Avenue, which runs through the city. The additional automobiles used by people going to and from the fair made this avenue very congested, so that movement was quite slow. The neck of the bottle, so to speak, was at a bridge over Grand River, a little more than ½ mile from the fair grounds. Motorists who traveled out Monroe Avenue in congested traffic and then had to wait at the bridge were naturally glad to avail themselves of parking space at that point and ride the railway company's cars the remaining distance to the fair grounds.

With the idea of increasing traffic on its electric cars, the Grand Rapids Railway established free parking space at three different locations. One of these was at North Park, at a point just before the bridge over the river was reached. In this space, about 2½ acres in size, the number of cars parked averaged from 100 to 150 per day during the week of the fair. Another parking space was established at the south side of the city, at what is known as the Detroit Street loop. This is a junction point for motorists coming in from the Kalamazoo district and other points south. By using this parking space motorists were relieved of the necessity of driving their cars through the congested city streets. The parking space on the south side consisted of about 3 acres and the number of cars parked there averaged from 50 to 75 per day during the fair.

A third parking space was established at Ramona Park. This is on the east side of the city and was convenient to the main roads from Lansing, Ionia, Flint and other towns east of Grand Rapids. The free parking space at Ramona Park consisted of a large tract and the number of cars parked there averaged from 25 to 40 per day during the fair.

In order to attract the attention of motorists to the free parking spaces, conspicuous signs were placed at the approach and entrance to the parking spaces. On the roads leading in signs were placed 500 ft. ahead of the free parking space. These read: "West Mich. Fair, Free Parking Space 500 Ft. Ahead, Watch for Sign." At the entrance to the parking space another sign read: "West Mich. Fair. Free Parking Space." A hand pointed the way. Inside the parking area a large sign was displayed giving advice regarding the avoiding of traffic dangers and accidents and pointing out that the electric cars provided a safe and comfortable ride to the fair grounds. This sign also gave instructions for obtaining car tickets without extra cost. These tickets were furnished by attendants at the parking places. These attendants directed motorists to the points where their cars could be parked and also supplied them with tickets, time-tables and other information about the railway. Through the use of this method the riding on the railway's electric cars was increased considerably.

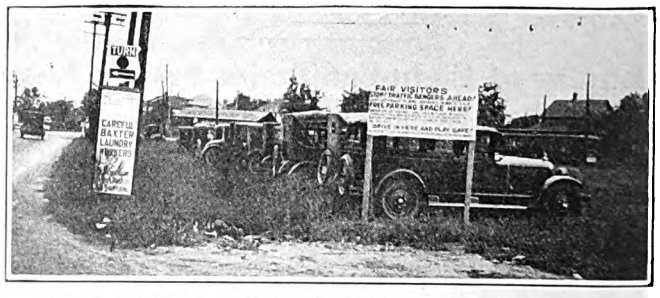


As the Motorist Reached the Edge of the City his Attention Was Attracted by a Large Sign

The Sign Attracted His Attention by Referring to the West Michigan Fair and Stating that There Was Free Parking Space 500 Ft. Ahead

At the Entrance to the Parking Place a Conspicuous Sign Was Displayed Stating that Free Parking Space Was at Hand

Inside the Space Limits a Large Sign Directed Attention to the Fact that Car Tickets Could Be Obtained from Attendants



The Total Number of Cars Parked at the Various Places Averaged from 175 to 265 Per Day

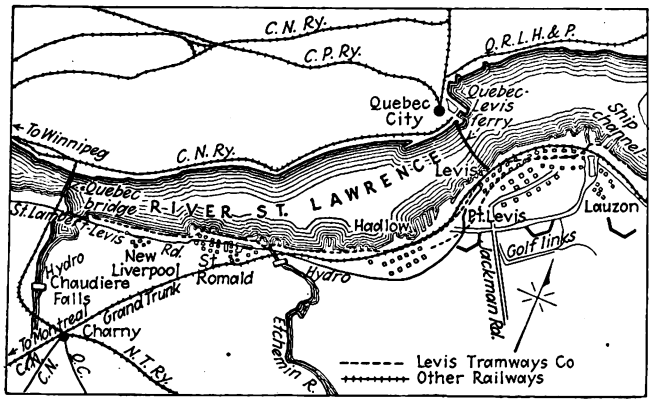
"La Passe Hebdomadaire"

Success with One-Zone Weekly Pass on Levis Tramways Leads to Two-Zone Pass with Harder-to-Buy Ticket Rate—French-Canadian Population Has Been Induced to Ride by Many Appeals to the Ideals of Thrift

By Walter Jackson
Fare and Bus Consultant

FIRST among street railways in the Province of Quebec and the second in Canada to adopt the weekly pass as part of its fare plan is the Levis Tramways. Its one-zone pass was installed May 17, 1925, and a two-zone pass was added Nov. 22, 1925. The circumstances surrounding these applications are a little out of the ordinary and are worth discussion in connection with the results attained.



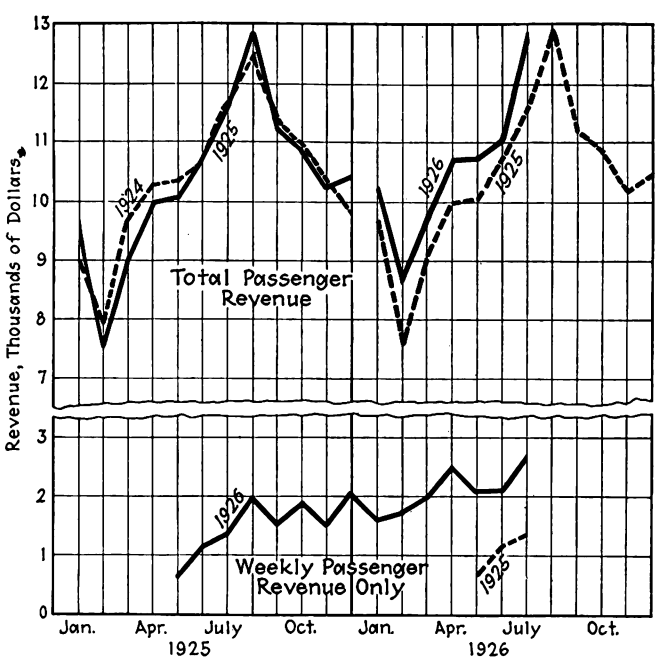
Map of Levis and Environs, Showing Routes of Levis Tramways and Points of Interest in and near Levis and Quebec

Levis County comprises the city of Levis, with a population of 11,000, and the town of Lauzon, with a population of 6,000. The latter comprises the eastern section, where are located the shipyards and drydocks. The railway, however, also serves the town of St. Romuald and two other villages, so the combined population is approximately 22,000. About 90 per cent of the people in the city of Levis live on the heights or upper level, while Lauzon and the town of St. Romuald lie along the narrow strip of lowland and foothills of the St. Lawrence River.

The railway system is operated in three divisions, known as the Up Town, which is in the city of Levis; Lauzon, which serves the town of Lauzon, and the Quebec Bridge line, which serves the town of St. Romuald and runs as far as the Quebec Bridge. The whole system is of suburban type, centering on the ferry to Quebec. The shipyards and drydocks at the eastern end of the line, with several lumber mills on the western end, are the only extensive sources of employment on the south shore. Most of the workers repair daily to the large city via car and ferry.

Within the one-zone ride in the city of Levis are a group of small stores and one theater. There is a second group at the eastern end in the town of Lauzon and a third group within the village of St. Romuald. Levis and Lauzon are within the one-zone ride, while St. Romuald comes into a second zone. The heights residents of the city of Levis are confronted with the disadvantage of climbing to get to their homes. This is an advantage to the railway, but, on the other hand, the railway is confronted with the disadvantage that these people can walk down in less time than the cars can carry them to the ferry. The traffic on the Up Town line in pre-pass days was therefore 100 per cent uphill and only 40 per cent downhill.

The churches and schools are located at such frequent intervals that persons can readily walk. Furthermore, the population is almost exclusively French and not given to riding abroad at night, as is proved by the low average number of rides per pass, viz., 2.5 daily in the one-zone area of Levis, compared with the more usual average of 3.5 to four net rides.



Graph Showing Improvement in Earnings of Levis Tramways, Particularly Since Addition of Second ($1.75) Pass and Change from Four Tickets for 30 Cents to Six Tickets for 45 Cents

In any case, the center of diversified entertainment is Quebec itself. This means that even a passholder would have to pay additional fares and give up extra time for the ferry trip and also pay two more fares within Quebec if he wished to avoid the stiff climb so nearly won by Benedict Arnold.

Despite these ride-selling handicaps, H. E. Weyman, general manager, decided to add the weekly pass to the then existing fares in Levis for three purposes—increase of good will, easier

Digitized by Google

fare collection on one-man cars and better revenue through encouraging the public to ride downhill too.

The third reason explains why the pass price was fixed at $1 against a cash fare of 10 cents and a ticket fare of 7½ cents (four for 30 cents). About 90 per cent of the riders were using tickets, with little or no short-haul riding. In fact, the average length of ride per passenger was approximately 2½ miles.

Usually the weekly pass covers the period Monday morning-Sunday night. The Levis pass is a proper exception in covering the period Sunday morning-Saturday night. One reason is that Saturday is the universal payday, and it is the custom of the people to spend what money they have on Saturdays and Sundays. A second and more local reason is that the French-Canadians are faithful churchgoers, in addition to which the after-church hours are very popular for visiting friends and attending to other social duties. Hence practically all pass-buying prospects are on the cars Sunday.

The immediate effect of the pass was to stop a decline in revenue, February-April, 1925, having run 4.7 per cent under the same period of 1924. Despite an unusual number of rainy Sundays in the summer of 1925 and the further disaster of a strike at the shipyards in August, the revenue for May-December, 1925, ran 0.6 per cent ahead of the like period of 1924. The year 1926, including January to July, shows a total revenue of $73,956, against $68,656, a gain of 7.7 per cent over the like period of 1925, when the pass had hardly been well introduced.

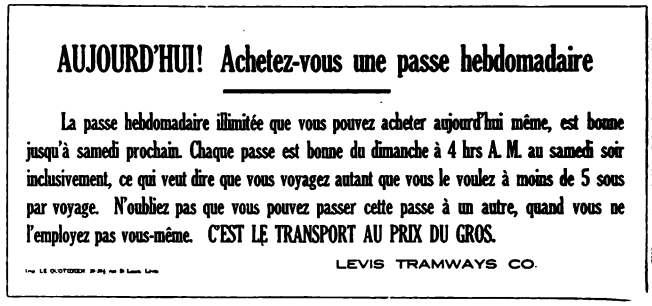
Second Pass Knocks Out Cheap Round-Trip Rate

Satisfied that the weekly pass was proving a good thing for both the public and the railway, Mr. Weyman considered its extension to the second zone of the St. Romuald route. He agreed to the liberal rate of $1.75 on condition that the manner of selling tickets be altered from four for 30 cents to six for 45 cents. This seemingly trifling change really was important, because many casuals who took a round trip could, and did, take advantage of the four for 30 cents rate instead of paying 40 cents cash. Thus it was easy for a person taking a round trip on the two-zone route to get a rate intended only for steady customers.

The $1.75 pass was added Nov. 22, 1925, and caused an immediate system increase of 35 per cent in cash fares and of 2 per cent in pass and ticket revenue combined. Although the $1.75 pass itself costs only 11⅔ rides at ticket rates, the actual increase in system revenue from transportation was 7.7 per cent. The accompanying graph shows how the pass stopped the decline in revenue and how the ticket change and $1.75 pass accelerated the increase.

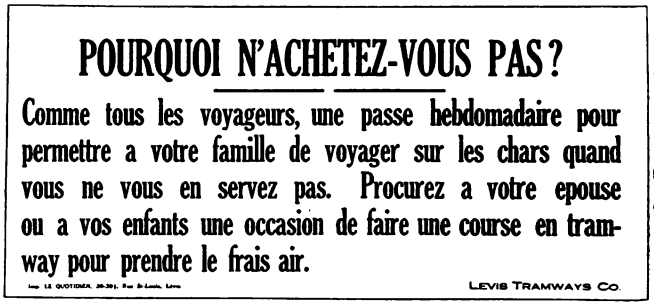
In this way a substantial decrease in fare to the regular rider, no change at all to the semi-regular rider and an optional increase to the casual rider produced more revenue and more patronage without any changes in service.

One good proof of the popularity of the pass under adverse conditions is that pass revenue now averages about 20 per cent of total earnings. Mr. Weyman's appreciation of publicity has had much to do with this result. In addition to his advertising in the press and to the many friendly editorial notices, he has made extensive use of placards both inside and outside the car.



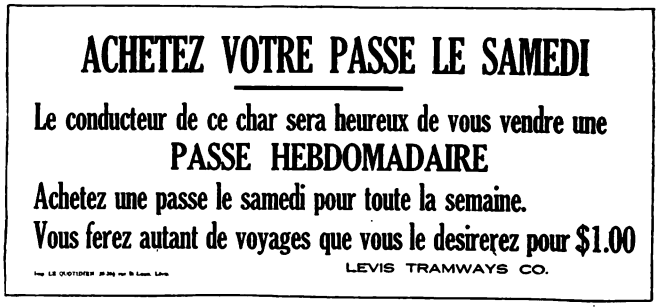
BUY A WEEKLY PASS TO-DAY!

The unlimited-ride weekly pass that you can buy today is good until next Saturday. Each pass is good from 4 a.m. Sunday to Saturday night inclusive. This means that you can ride as much as you please for less than 5 cents per ride. Don't forget that you may pass the pass to some one else when you do not require it yourself. This is transportation at wholesale prices.



WHY NOT BUY A PASS

Like other passengers to permit members of your family to ride the cars when you are not doing so? Give your wife or one of the children a chance to get some fresh air by way of a car ride.



BUY YOUR PASS SATURDAY

The conductor of this car will be pleased to sell you a Weekly Pass. Buy a pass on Saturday for use all of the week. For $1 you can make as many trips as you please.

Several of these placards are reproduced, together with translations. Another (not reproduced) read as follows:

Achetez Une Passe

Et quand vous ne vous en servez pas, pretez-la a quelqu'un pour aller a l'eglise, au magasin ou faire visite a des parents ou amis. Faites des Passes Hebdomadaires ce que vous faites d'un bain dan vos familles. Servez-vous en tous, mais un a la fois.

Translation

Buy a Pass

And when you are not using it, lend it to some one else to go to church, to the stores or to make a visit to relatives or friends. Use a Weekly Pass as you would a Family Bath—All use it, but one at a time.

Inauguration of Pleasure Tours for Tourists and Local Patrons

In connection with the map, it may be mentioned that during the summer of 1926 the management inaugurated combination tours for both tourists and local patrons. One tour is a combination of taxi, ferry and trolley to near the end of the Quebec Bridge; a second

Digitized by Google

combination covers an automobile or coach trip to Charny, the remarkably interesting Chaudière Falls and Basin and Quebec Bridge, and return by trolley with a fine trans-river view of Quebec; while the third covers a bus ride to St. Michel de Bellechase, with luncheon on a farm. The respective charges are $1, $2 and $2.50. In this way the south shore of the St. Lawrence has been made as accessible to the sightseer as the long-familiar north shore. Tickets for these trips are sold in Quebec at the Château Frontenac and at various railway and tourist agencies.

On the occasion of the Aug. 7, 1926, Levis historical number of the Quebec *L'Evenement*, the Levis Tramways used a full page of display advertising to feature its share in the growth of the community and to announce the foregoing new services which, in themselves, will do much to make Levis and environs better known.

In this advertisement the company mentioned that it operated 12 miles of track, had equipment valued at $900,000, used modern cars averaging a cost of $10,000 each, paid out $60,000 to $70,000 a year in salaries and wages and carried 2,000,000 passengers a year. The transferability of the weekly pass also received special note. The advertisement concluded thus:

"The service of the Levis Tramways is comparable to that of the largest cities in America, and the public has reason to be satisfied therewith."

Baltimore Studies Energy Consumption of Cars

Oscillation Tests Help to Determine Energy Taken in Car Operation and Result in Improved Methods of Lubrication

FOR the last year and a half the United Railways & Electric Company of Baltimore has been making a systematic investigation of the factors entering into the energy consumption of car operation and available means for its reduction. An account of means for utilizing the heat wasted in motor rheostats for car heating in cold weather was published on page 892 of the issue for Nov. 13. In addition, a series of tests has been conducted to determine the extent and character of other preventable losses, and the company hopes, as a result, to reduce its power bill further by from $100,000 to $175,000 a year. Particulars are given in the company's brief in the Coffin award contest, and from that statement the following facts were taken:

First came a series of oscillation tests. The primary purpose of these tests was to determine the frictional losses of cars under existing service conditions, to ascertain the most economical kind of lubricant for the Baltimore system, and to determine the savings to be achieved through relubrication of the cars. Next came a series of energy consumption tests, which was simply to check up the results of the oscillation tests.

For the oscillation tests a valley between two hillsides was selected. The grades on either side of the valley were approximately 6 per cent. The car was placed on one of the inclines 700 ft. from the lowest point of the valley and at an elevation 36.27 ft. higher than this point. At this elevation the car had approximately 1,632,000 ft.-lb. or 0.615 kw.-hr. of potential energy. Then, when set free, it coasted down the incline, ascended the opposite grade and then oscillated between the two inclines until it finally stopped at or near the lowest point in the valley, having dissipated all its potential energy in frictional losses.

During the tests the number of oscillations made by the car, the distance traveled on each oscillation and the total time elapsed before it came to rest were recorded. Dividing the car's total potential energy at the start by the total distance in miles traveled gave the investigators the frictional losses of the car per mile. Cars which were efficiently lubricated naturally made more oscillations, covered longer distances and consequently showed lower frictional losses per mile than others in which the lubrication was defective. It was thus possible to determine the relative merits of different grades of lubricant.

Not only was this a test of lubricants but a test of the effect of temperature, brakeshoe clearance and general condition of maintenance, with all the disturbing factors such as varying voltage, loads and traffic conditions eliminated. The cars tested were selected at random from among cars at one of the big terminals, and the investigators found quite a difference in the adjustment of the brakeshoes and that some of them had little clearance. The tests, extending over a long period, indicated that it was possible to reduce friction in a well maintained car by as much as 50 per cent.

Thereupon an analysis of the movements of more than 1,300 cars was undertaken for the purpose of discovering a new method for determining proper periods for oiling and inspection of individual cars. The investigators endeavored to learn to what extent the devices on cars for recording the number of minutes during which power is used might also be used to determine a proper frequency for inspection and oiling. It was necessary to fix constants for each type of operation, and the percentage of each type of operation, such as dense traffic, suburban and rural, were checked so that the limits of accuracy would be definitely known. As a result, the company is now oiling one line by the minutes of power consumed, based on an indicated unit of 2.5 minutes of power use to the mile. It finds this method much more satisfactory than the former one, in which oiling and inspection was done on a time basis, and the new plan will be extended over the entire system. It will also use these data to determine the mileage performance of individual cars. Hitherto, the mileage records of the cars have been kept by a special bureau. It is believed the present plan will provide a more accurate record and at a large reduction in clerical and tabulating machine cost.

To maintain proper control over this entire set of experiments the company is constructing curves which show the energy consumption and the various factors affecting it from month to month. These curves show the average monthly kilowatt-hour consumption per car-mile per month, the average temperature per month and the average weight per car-mile per month. The consumption has been found to vary almost exactly inversely with the temperature. To eliminate the necessity of comparing one curve with another, the investigators have constructed a curve running back over the last five years on which the temperature curve has been inverted and plotted downward from the top of the sheet. This inverted temperature curve has thus become the company's standard, and the object is to reduce the kilowatt-hour curve as far below the temperature curve as possible. So far as the company knows, its use of an inverted temperature curve for a standard is original in the electric railway industry.

Pooling of London Passenger Transport Facilities Proposed

London and Home Counties Advisory Committee, in Two Reports, Suggests Working Agreement Between All Local Passenger Transport Facilities, Including Rapid Transit Railways, Electrified Railroads, Tramways and Motor Buses—Only in This Way Can Waste of Service Be Prevented

SETTING up of a common management and a common fund to which all the passenger transport undertakings in London, including the Underground and other local railways, the tramways and omnibus lines, would be parties, is the outstanding recommendation of two reports made by the London and home counties traffic advisory committee of the Ministry of Transport on the subject of improvements in and co-ordination of passenger traffic in London. One of these reports, which deal with transit problems in the London area, covers north and northeast London and the other east London. The inquiries on which these reports were based were held before a committee of which Sir Henry Maybury was chairman, the former on ten days between Oct. 10 and Nov. 26, 1925, and the second on seven days between March 10 and 29 last. A third inquiry, relating to southeastern London, was only recently completed. No inquiries were held in regard to other districts of London, presumably because the facilities are better there.

In the first report is contained a summary of the evidence and suggestions put forward for a common management and a common fund. It is stated that a comprehensive and far-reaching proposal for meeting the difficulty of finance, which appears to be the stumbling block of all schemes of railway development in Greater London generally, was put forward on behalf of the Underground group. This proposal is not, however, confined to the problem presented by the conditions obtaining in the north London area, neither does it appear to be intended to meet only the difficulties of today. The proposal aims at a permanent solution of the whole problem of London passenger traffic.

The common board of management would, under the plan, be responsible to an over-riding authority who would settle questions of policy, determine broadly the form and nature of the facilities to be provided, settle the principles upon which fares would be charged on each form of transport, and generally exercise financial control. An outstanding feature of the scheme is that there would be no disturbance in the ownership of the existing undertakings. Their officials, who would constitute the board of management for operating purposes, would therefore have a dual responsibility, on the one hand to the owners of their undertakings and on the other hand to the over-riding authority. Under this proposal it is suggested that all the existing forms of transport could be co-ordinated so that each would be performing the functions for which it is best adapted, and the present uneconomic and wasteful competition could be eliminated, while it would be practicable to give the public more efficient services than at present are given.

The question whether the suburban service of the four main-line railways should be included as a part of this plan was touched upon, but the evidence on the point was not sufficient to allow of any definite conclusions being drawn. The matter, however, is one which will require further consideration.

Steady Development a Necessity

The proposal is based on the premise that, given such co-ordination, there is in London sufficient traffic not only to provide a satisfactory return on the large amount of capital already invested in transport undertakings, but to provide also a margin of income which would enable a steady growth and continuous policy of development to be pursued.

The Metropolitan Railway, a section of whose undertaking forms an integral part of London's local underground system of railways, suggested that a scheme for common management presented considerable difficulties for the reason that it involved a common financial interest in traffic, but all the transport interests represented at the inquiry, with the exception of the independent bus proprietors, seemed to be in general agreement that a condition precedent to any further expenditure on the development of railways is co-ordination of street transport and the restriction of omnibus competition having regard to the alternative facilities provided.

This view was not fully accepted by some representatives of local authorities and other public bodies present at the inquiry, who appeared apprehensive that their difficulties are being exploited by the railways for the purpose of obtaining a cessation of bus competition. The London County Council, however, is on record as favoring unified operation of local passenger transport undertakings under a municipal traffic control authority, provided that in the event of a reorganization of the local government a new authority might be set up by the municipality.

Specific Proposals for North and Northeastern Districts

The committee is led to the conclusion that the difficulty of passenger transport between the districts north and northeast of Finsbury Park and the central London area is primarily because there has been no adequate increase in through traveling facilities to meet the large increase in population in the past quarter century. A large proportion of the public is forced to make at least one transfer. Moreover, the facilities for changing cars, especially in inclement weather, are the main reason for the discontent of the riders from this district.

The lack of efficient and rapid transport facilities has retarded the development of the area. Given ade-

Digitized by Google

quate and rapid transit an increase of at least 50 per cent in passenger traffic might reasonably be expected in the course of a few years.

There was a strong expression of opinion that in not improving certain of its local lines and in not electrifying its suburban system the London & North-eastern Railway has exhibited a want of consideration for the needs of the suburban traffic. It was urged that the result of this failure to keep abreast of the times is that, as compared with other railways, its services are costly, slow, infrequent and inconveniently arranged. Until it is electrified, it is felt that this railway cannot render any material assistance to the solution of the problem. Further information on electrification of this system should be obtained. The reluctance of the railway to embark on the work of electrification might be removed if it were assured that steps would be taken to insure that the electrified lines would be protected from unnecessary competition, so that the railway might be afforded the fullest possible opportunity of obtaining a reasonable return on the additional capital invested. Specific recommendations for an extension by the London Electric Railway and suitable transfer facilities were made.

As to the electric railways, the accommodation provided is greatly in excess of the demand, the seats provided in each direction on the Piccaddilly line, for instance, on a normal day being 75,000 for 18,000 passengers.

It was mentioned that 18 per cent of the total tramway passengers are carried at unremunerative workmen's rates provided by statute. With ordinary fares there would have been a gain in revenue of £114,000, or 5 per cent on the capital of the company. The buses are not required to offer similar fares and do not provide corresponding service in the rush hours.

Prior to 1922 all the omnibus service in the area was operated by the London General Omnibus Company and its associated companies, which appear to have had some regard to the alternate facilities provided by the tramways. Beginning at that time the number of independent competing buses has rapidly increased, and in order to protect itself the L. G. O. Company has felt it necessary to increase substantially the number of its buses. As a result there is no longer that co-ordination which up to 1922 had existed between the bus and tramway undertakings and buses operate in large numbers over the whole of the tramway routes in the area.

It was contended that neither tramways nor buses would meet adequately the needs of the public in the outer areas, on account of slow speed and limited accommodations. The average speed of the buses in the London area was, in fact, found to be slightly less than that of the tramways, being 9 m.p.h., as compared with 9.6 m.p.h. for the tramcars.

Finally, the committee pointed out that it has been impressed by the contention of the representatives of the railway companies and the tramway undertakings that the main difficulty in the way of the provision of suitable through facilities is the acute and wasteful competition between the various passenger transport agencies operating in the area. The proposals submitted on behalf of the Underground group appeared to it to furnish a possible solution of the whole problem of London passenger transport. It was recommended that these proposals, referred to earlier in this article, should be carefully examined with the least possible delay. The committee, feeling that consideration of the plan was outside the scope of its assignment, requested the Minister's authorization before proceeding further with it.

PLANS FOR EAST LONDON

In the second report, that on east London, the committee states that the inadequacy of the through railway traveling facilities to and from that section generally has been established. This condition exists because the improvements in the facilities have not kept pace with the increase in population which has taken place during the past 25 years, and the even greater increase in the number of persons desiring to travel.

It is clear, in the opinion of the committee, that electrification of the steam railway lines in this area would afford the speediest means of providing a substantial improvement in the train services. A representative of the Metropolitan District Railway, who has had considerable experience in the operation of electric train services, stated at the inquiry that experience has shown that the capacity of a line can be increased from 100 to 200 per cent by conversion from steam to electric working.

Similar statements relative to wasteful competition of trams and buses were made as those referred to in the report on north London. Throughout the day only about 21 per cent of the available bus and car seats were occupied, while even in the peak hour no more than 56 per cent of the car seats and even fewer of the bus seats were occupied.

With regard to competition, the committee stated: The evidence submitted by the representatives of the local authorities, particularly those owning tramway systems, as to the adverse effect of unnecessary omnibus competition with tramways provides sufficient justification of the soundness of the policy adopted by the committee with regard to the restriction of such uneconomic competition.

Finally, the committee desired to add that the evidence submitted at this inquiry strengthens its view that no lasting solution of the London passenger transport problem can be secured so long as the present competitive methods are pursued. It is only by the elimination of all wasteful, uneconomic and unnecessary competition between the various transport agencies that it will be possible for any considerable improvements to be effected, particularly in the way of the construction of new underground or surface railways. As a means toward this end the committee, in its report upon the inquiry on the traveling facilities to and from north and northeast London, stated that the proposals submitted at that inquiry for the establishment of a common management and a common fund appeared to it to present a possible solution of the whole problem of London passenger transport. The evidence submitted at the inquiry upon which this report is based has convinced the committee that the unified management of the local passenger transport agencies—i.e., underground and other local railways, tramways and omnibuses—would provide the only permanent solution of the whole problem of London transport.

Speaking in the House of Commons on Nov. 30, Col. Wilfrid Ashley, Minister of Transport, stated in reply to a question that after consideration of the recommendations in the two reports he has asked the London traffic advisory committee to explore further the possibility of the institution of a common fund or of working agreements in connection with the operation of passenger traffic undertakings in the London area.

The Readers' Forum

Saving Paper in Committee Reports

NATIONAL ELECTRIC LIGHT ASSOCIATION
NEW YORK CITY, Dec. 6, 1926.

To the Editor:

Your editorial of Oct. 16 headed "Too Much Paper Used in Some Committee Reports" was of great interest to this office, as in the last 2½ years we have been proceeding along the lines of your editorial, and, thanks to the hearty co-operation of all concerned, with considerable success. Under the leadership of C. F. Hirshfeld, chairman, the Engineering National Section has been making a determined effort to make its reports as pithy as possible with the result that whereas in the year 1923-24 31 Engineering Section reports required 1,141 pages of type, 36 reports in the administrative year 1925-26 required only 992 pages. This is a reduction in the average size of reports from 36.8 pages to 27.5 pages.

The same policy of condensation has been applied to all reports and, thanks to the efforts of A. Jackson Marshall, secretary of the association, and the chairmen of the other sections, we have been able to reduce the size of our Proceedings from 1,912 pages in 1924 to 1,664 pages in 1926. We do not feel, however, that the maximum brevity has been attained and all efforts are being made toward increased economy in language and maximum content of information.

Figures on Car Speed in London

WALLINGTON, SURREY, ENGLAND, Nov. 26, 1926.

To the Editor:

Table V in Mr. Jayot's article on page 891 of the JOURNAL of Nov. 13 gives the average car speed of the London Tramways as 6 m.p.h., almost the lowest in the table. Actually, the average speed is 9.6 m.p.h. on the principal, or London County Council, system and slightly more on the combine systems. The average is therefore, apparently, the highest of the cities enumerated.

Apparently the figures relating to passengers carried annually and number of cars in service in London refer to the combine systems only. It is not clear why London is credited with only 416 cars in service when L. C. C. system has 1,850 cars in stock apart from the combine.

Furthermore, the 1,086 cars listed against Glasgow refer to cars in stock, not average in service.

I observe that while figures are given for the Leeds system several much larger British systems are not included. Hence the data given in the table abstracted from the paper by Mr. Jayot are not very representative.

HENRY A. WATSON.

EDITOR'S NOTE.—As explained in the article, the figures given in table V were based on replies received to a questionnaire sent out by the International Association. The table contains only the data of those systems which replied. In the case of London the replies relate only to the Metropolitan Electric Tramways, the London United Tramways and the South Metropolitan Electric Tramways but do not include the London County Council Tramways. As only part of the London tramways were represented, no figures were given in the columns showing population served and annual rides per inhabitant for London.

As One Passenger Sees It

SAGINAW, MICH., Nov. 10, 1926.

To the Editor:

On a recent trip I made on electric interurban lines in Michigan and Ohio I encountered a number of practices which suggested reasons why some of these lines are losing passenger traffic. On leaving the terminal there were approximately 100 passengers on one car.

After getting as many as possible on board this car, several were turned away. There seemed to be no one in authority to tell them whether or not another car would be added. After quite a delay a second car was coupled on. Before reaching an important intermediate station all passengers going beyond that point were transferred to the head car, which was already well loaded. Thereafter it was packed, several women sitting in the smoking compartment. This car was built of wood, needed paint and was very dirty.

In the terminal city I found that the interurban stations were quite a distance apart, forcing a person with baggage to use a taxicab to get from one to the other. On the next lap of my journey I rode a two-car train. This was a very comfortable ride. The cars were clean and equipped with white seat covers. The power was weak, however, and the speed was entirely too slow to meet with public approval.

Then, too, there have been few improvements made recently in seats. Why not install seats similar to those being used in motor coaches, with air cushions that are really comfortable to sit in, and space them farther apart than the present car seats? It would make very little difference in the total seating capacity —possibly about two seats.

Electric roads must now depend on through traffic and the small lines should be consolidated in order that through service can be given over a larger area. If consolidation is impossible, through cars should be operated. At present, in order to get between two important Ohio cities, a stopover of 1½ hours at an intermediate point is necessary. How can the railways expect to get traffic when such conditions exist?

Great care should be taken when selecting platform employees, as they are the ones who come in contact with the public. There should be a meeting held at least once a month and the men instructed in the art of salesmanship so they can really sell transportation to the public. Courtesy to the public is the most important qualification for being an efficient platform man.

Most people would prefer an interurban car to a bus if they both gave the same quality of service. Congestion on the highways has become severe. Now would be a good time for the electric railways to start giving the kind of service that would win back the public favor they formerly enjoyed.

It seems to me that electric lines would do well to advertise more in the daily papers, calling the attention of the public to the fact that they are selling transportation for far less than the cost of operating an automobile. Some time ago I was talking to a man who uses the electric interurban to get to and from his work every day. It costs him about $60 a year. He said his neighbor who works in the same factory bought a used automobile, paying $300 for it, and at the end of a year of traveling back and forth it was worn out. Thus one year's transportation cost the second man $300 besides the upkeep of his automobile. Why not do more publicity work to tell the public about such cases as this?

A DAILY INTERURBAN RIDER.

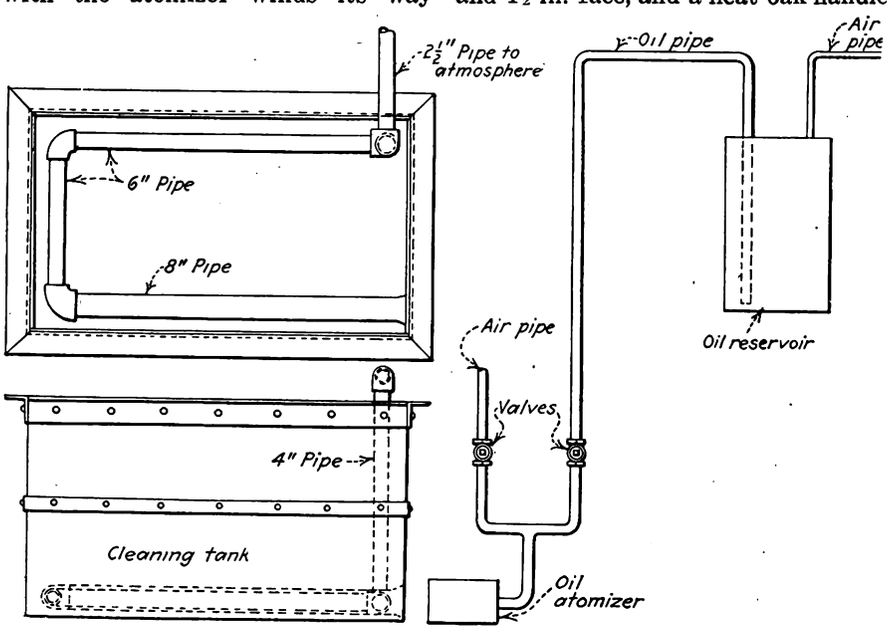
Maintenance Notes

Cleaning Mechanical Parts Prolongs Life

GREASE, dirt and brake shoe dust are removed readily from mechanical parts by boiling in an Oakite solution in the shop of the Reading Transit Company, Reading, Pa. Thoroughly convinced that in order to prolong the life of certain mechanical parts it would be essential to give more careful attention to their cleanliness during the overhauling process, H. E. Aldrich, master mechanic, searched for suitable equipment to accomplish these results. Inability to obtain in the market just what was required, necessitated the designing, building and erection of equipment with the shop organization from the material on hand.

The principal parts of this equipment consist of a tank with heating pipes, atomizing oil burner, oil storage tank and suitable pipe connections. The general arrangement of this apparatus is shown in the accompanying sketch. The tank is constructed of ⅛-in. boiler plate rigidly reinforced with ½-in. angles and 1-in. x ½-in. flat steel. An 8-in. iron pipe welded to the tank directly in line with the atomizer winds its way around the bottom of the tank and gradually reduces in size until it makes its exit to the atmosphere at a diameter of 2½ in., this reduction being made to prevent rapid heat exhaust. The flame from the atomizer entering the 8-in. pipe raises the temperature of the solution very rapidly to the boiling point. Storage of oil is taken care of by an 8-in. x 36-in. tank conveniently located on the wall above the atomizer. Air is used to force the oil from the tank to the atomizer as well as to assist in the vaporization of the oil at the atomizer. Since motor bus engine oil discarded from the crank case is used for fuel the cost of operation is extremely low.

Equipment to be cleaned, such as motor housings, gears, pinions, journal boxes, trolley bases, bearings, etc., is immersed in the Oakite solution and permitted to boil for a certain length of time. After removal it is found to be free from grease, dirt or brake shoe dust. This apparatus has proved a valuable addition to the equipment of the Reading Transit Company's shop and the results which have been obtained have been far greater than expected.

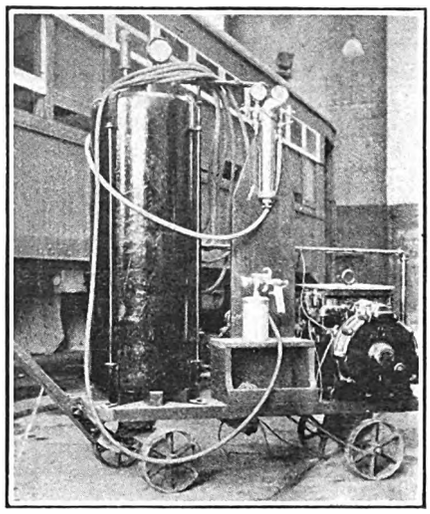


General Arrangement of Cleaning Tank, Oil Storage Tank, Atomizer and Piping for Cleaning Metal Parts

Portable Paint-Spraying Equipment

PAINT spraying is not an innovation in the shop of the York Railways, York, Pa., but the desire to concentrate the spraying equipment in a portable manner led E. L. Greene, master mechanic, to design and build a small compact truck for this purpose. This truck is about 18 in. wide and 4 ft. 6 in. long and is constructed of 1-in. oak boards fastened securely to suitable steel axles. Iron wheels, 6 in. diameter and 1½ in. face, and a neat oak handle make movement throughout the shop easy.

On the front of the truck is a 16-in. by 48-in. vertical air reservoir with a gage and safety valve. It is held in place by 4½-in. tie bolts



Paint-Spraying Equipment Mounted on Truck

fastened to saddles over the top of the tank and angle irons bolted to the truck floor. A National AA-1 compressor bolted to the floor on the rear end of the truck furnishes the necessary compressed air for spraying. A De Vilbiss Manufacturing Company's paint-spraying equipment is conveniently mounted on a

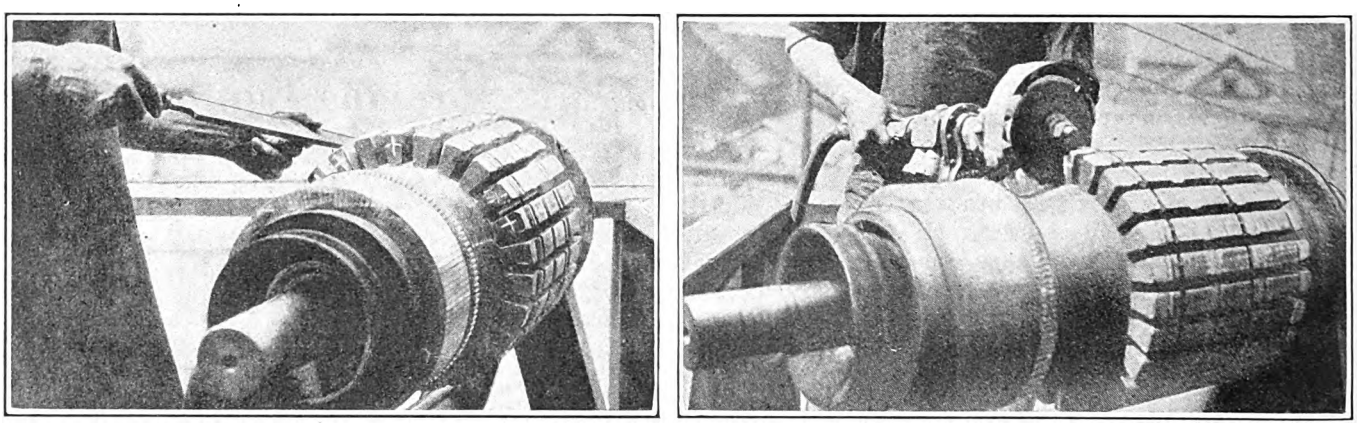
Digitized by Google

tapered oak plank between the compressor and the air reservoir. The pistol grip type spray gun is used.

This paint-spraying equipment, with its tank and compressor painted black and the remainder with color combinations corresponding to the car colors, presents a very attractive appearance. The compactness of design, together with the ease with which it can be moved about, gives the shop a portable outfit readily transferable to any point and a means for doing quickly and effectively any desired painting job.

Time Saved by Grinding Armature Cores

GROUNDING or short circuiting of armature coils usually results in burning the armature core laminations. These burns and blisters must be removed in order to rewind the armature properly and not allow projecting edges to damage the winding. Where the armature core slots are cleaned up by filing the operation is quite long and tedious. In the Hall Street shop of the Grand Rapids Railway this work is done by a portable air grinder. An emery wheel 4 in. in diameter by ¼ in. thick is used. This is driven by a No. 7 Simplex air grinder. In order to prevent particles from flying about the shop a guard has been placed over the wheel. This is 2 in. wide and is made of a piece of band steel welded to the frame at both ends. By use of this method blistered laminations are cleaned up in 50 per cent of the time formerly required by filing.



At Left, the Old Method of Cleaning Armature Slots and Removing Blisters from Laminations Was by a File. At Right, with the New Grinder the Time for Cleaning Armature Laminations and Slots Has Been Reduced 50 Per Cent

Many an armature that gets "het up boils"
May be traced indirectly to "bad order" field coils.

Should Grounds of Electric Railway Systems Be Burned Off?

BY G. H. MCKELWAY
Distribution Engineer Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y.

BURNING off grounds on electric railway systems is a practice confined most generally to the medium-sized systems rather than to either the small or large ones. Small systems do not follow it because they have not the generator, converter or feeder capacity in service to burn off a heavy ground without overloading the machinery or feeders, so there would be as much likelihood of burning up one of these pieces of apparatus as there would be of burning off the ground. Again, the delay to the line on account of leaving a circuit breaker out until the ground can be cleared is by no means as important in a small town as it would be in a large city.

Another reason why the small company does not find it advisable to burn off a ground is the additional cost of repairs. The destruction of a part of the trolley wire and the annealing of much more of it may mean a great deal to a struggling line. Therefore certain companies prefer to have a little longer delay and be able to repair the trouble by the use of a single splicer.

When the system is in a city of 50,000 or more inhabitants there is a much greater chance of the power or substation attendants keeping the circuit breaker closed and attempting to burn off the grounds when they occur. The station and feeder capacity are greater, the objection to delay is greater, the cost of repairs is relatively small, and there is not such close co-operation between the men of the power and line departments. With very large companies, as a rule, the pendulum of practice swings back to the same position as for small companies, although not for the same reason.

The large company has at least as much objection to delay as the medium-sized one has, if not more. It has all of the generator capacity necessary for burning off the grounds and the increased cost of repairs is negligible. The objection to burning off grounds on large properties is based not on greater cost of repairs, but on greater liability of accidents that would injure people or result in greater damage to the railway company.

A broken trolley wire falling on and perhaps entangling itself around a crowded car will cause a flash, which will probably frighten some of the passengers. There is still more liability of this occurring if the single flash caused by the falling wire is followed by additional ones, as the station operator closes the circuit breaker several times in succession, or holds it shut in an effort to burn off the ground. Injuries to passengers are caused not alone by burns from the arc, but by bruises and cuts occasioned by the stampede which may result from a series of flashes.

Even if the wire falls clear of the car and grounds on the rail, attempts to clear the ground will be delayed if it is arcing. When the ground has burned off the wire will usually be found to have been annealed back to at least the first side feed. As a result several sections of trolley wire will have to be run in, and this will result in a "moving block" that often

Digitized by Google

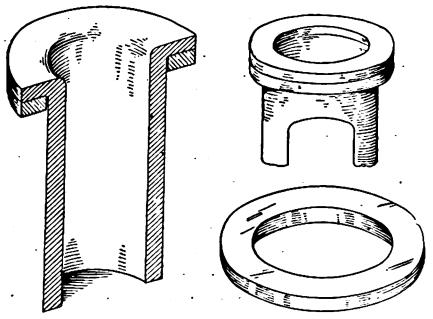
will cause more annoyance than the short delay to the entire system.

If the ground is on a feeder much more power is required to burn it off, especially with a system consisting of underground cables, such as are often used on large systems. There is greater danger of the trouble spreading on such installations from one cable to another and at least involving several cables so as to cause a bad burn-out and a prolonged delay, not to the one line alone but to several, and with the expense of repairs running up into thousands of dollars.

A wreck on a third rail line is liable to ground the conductor rail, and by trying to hold in on such a ground cars may be set on fire and possibly cause serious accidents. On the Brooklyn surface lines it is the custom to close the breaker at once if it has opened, and then, if it comes out again, to wait a half minute before closing it. If it comes out a third time it is the practice to notify the chief operator and close the breaker at longer intervals, as instructed by him. On third rail lines the feeder is always picked up first on a test resistance to see whether the breaker came out on an overload or on a ground. If the latter is the case, it is left out until the ground has been cleared, it being tried out on test resistance from time to time.

Bearing Flanges Reclaimed

UNDERSIZE armature and axle bearing flanges are being reclaimed in the shop of the Lackawanna & Wyoming Valley Railroad,



Reclaimed Bearings and Cast Ring. Axle Bearing at Left and Armature Bearing at Right Show Rings Installed

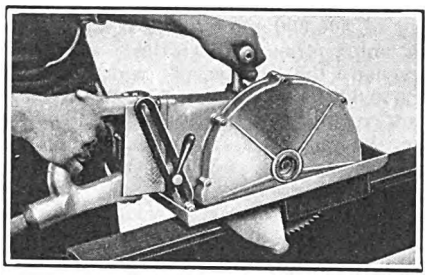
Scranton Pa., by the installation of a cast ring of the same chemical composition as the bearing. The worn outside surface of an armature bearing and one surface of a cast ring are machined, sweated together, riveted and turned to standard size. In the case of an axle bearing, the ring is sweated and riveted to the back face of the flange and then turned to size.

New Equipment Available

Portable Electric Hand Saw

FOR use in sawing lumber on construction jobs, the Wappat Gear Works, Pittsburgh, Pa., has placed the "Alta" portable electric hand saw on the market. It is provided with a universal motor and cuts boards as thick as 3 in.

A special feature of the device is a telescopic guard which incloses the blade and opens automatically when



New Type of Portable Electric Hand Saw

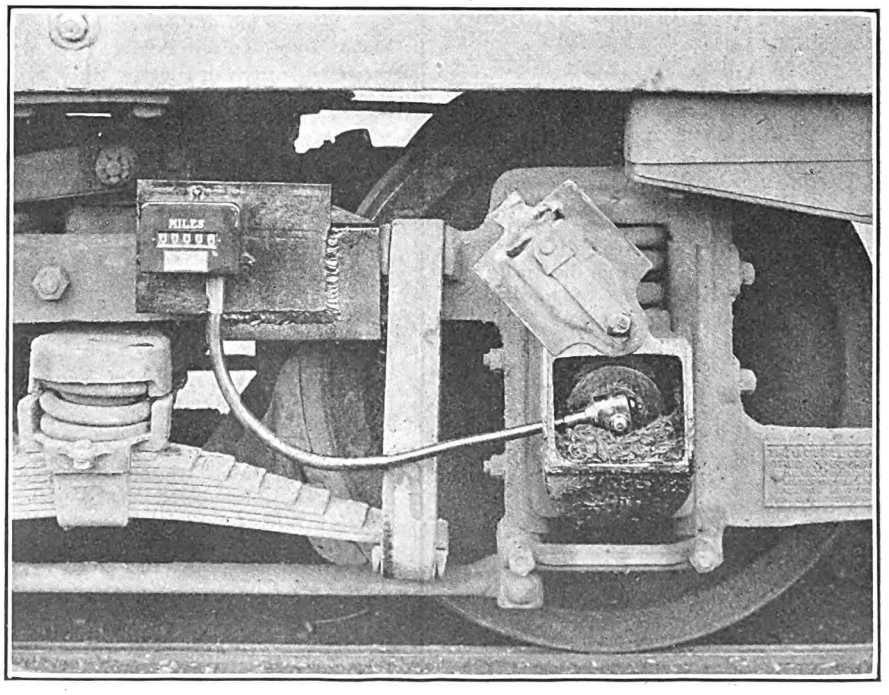
the saw is pushed into the material. The guard closes again as soon as the cut is completed. This provides safety against accident and also protects the blade from damage. To prevent tipping, a wide carrying shoe supports the weight of the tool so that the only effort of the operator necessary is to guide the saw. The shoe is adjustable so that it may be set for any depth of cut.

An air blast from the motor ventilating fan is directed to the front of the saw blade to blow dust away. Particular attention has been given to placing of the handle so as to give good balance and to eliminate wrist strain. The outfit weighs 31 lb.

Odometer Used on Street Cars

MILEAGE is recorded in both a forward and backward direction by an odometer which has recently been adapted for use on electric cars by the Ohmer Fare Register Company, Dayton, Ohio. It was described in ELECTRIC RAILWAY JOURNAL, July 4, 1926, but the first installation for street car use has just been made. As shown in the accompanying illustration the device may be mounted on the truck frame and connected by a flexible shaft to the worm gear attached to the axle in the journal box. This shaft rotates very slowly, making but 63 turns to each mile traveled by the car. Thus there is but little wear and tear on the mechanism of the odometer.

The figures shown in the recording window of the odometer are large and easily discernible from a considerable distance. The figures snap into place as each mile is covered, so that there are no half figures to interfere with the reading of the mileage.



First Odometer Installation for Street Car Use

Association News & Discussions

New York Subways Saturated

President of Interborough Rapid Transit Company Tells Institute of Electrical Engineers No Relief for Transit Is in Prospect Until Greater Track Capacity Is Provided

FRANK HEDLEY was introduced before the audience at the meeting of the American Institute of Electrical Engineers in New York on Friday evening, Dec. 3, as the president of the Interborough Rapid Transit Company and the editor of the "Subway Sun." Before he launched into the subject of giving the facts with respect to passenger movement over his lines Mr. Hedley said he would like to tell the truth, the whole truth and nothing but the truth about rapid transit in New York, but the institute meeting was neither the time nor the place.

It seemed unusual to him that a man should be asked to speak about transit who has devoted most of his life to the study of the subject. Tis own feelings were very much like those of his own customers. They thought they knew more than he did about running the railroad, and he often thought that he knew more about railroad matters than did his president, so when he was elected to the post of president he kept both titles and is now both president and general manager.

Traffic figures which he quoted were startling in their totals. Mr. Hedley said, however, that his friends among subway riders were not disposed to doubt the veracity of his remarks. Their experiences, particularly in the subway, led them to think Mr. Hedley was conservative in his totals. Mr. Hedley said that his riders might be likened to tenants, of whom there were 3,500,000 a day, and many of them left gum behind them on the seats as a final decoration.

The burden of Mr. Hedley's remarks was to the effect that the eight main line tracks on the system were saturated with trains at the rush hour and that the situation could be relieved only by the construction of additional tracks. One of his quips was that the capacity of the subway today resolved itself into the question of the physical strength of the people who push themselves in. His aim was to tell what the company did with what it had to do with. The success attained was due to the assistance of the heads of the various departments, and the best results were secured only by discussion among the men themselves. The criterion of the company was the greatest number of passengers that could be transported with safety.

As a measure of the extent of the service of the company, he said that on Nov. 29 3,875,000 passengers had been carried safely on both the elevated and subway lines. The original subway had been built with an estimated capacity of 300,000 passengers a day and a maximum estimated capacity of 500,000 passengers a day. Only a short time after the lines were opened the company was carrying 1,000,000 passengers a day and at present it is not unusual to transport on the enlarged system 2,500,000 subway passengers and more than 1,000,000 elevated passengers each day.

Mr. Hedley also reviewed very briefly some of the aspects of the technical and physical operation of the system. He told about the company's own power stations, the emergency connection with the system of the New York Edison Company in order to insure uninterrupted service, the signal system on both the subway and the elevated, methods of track protection at curves, the inspection of system of track to guard against possible track failures, the blockade alarm system so as to inform operators of any tie-up and the ventilating equipment.

He also told about the work of the company in its effort to speed up the movement of trains, showing that with seven motor cars to a standard train a capacity of 4,000 hp. could be developed at 1.7 m.p.h.p.s. acceleration, with the motorman notching up from the off to full, or parallel position, at one turn of the controller handle. The retardation problem was not so simple, but with the electric pneumatic brakes applied to all the cars at one time, a constant pressure in retardation of 2 m.p.h.p.s. had been attained, or about 40 per cent better than on the steam railroads. He then went into the subject of inspection of cars. This is done on a mileage basis of 1,200 miles. A particularly complete record of work on the cars is kept and the men responsible for the defects are disciplined if the cars do not make the allotted 1.200 miles. Many of these practices have been described before in the ELECTRIC RAILWAY JOURNAL.

The other speaker of the evening was George S. Silzer, formerly Governor of New Jersey and now chairman of the New York Port Authority. This board was created by an act passed in 1921. It was born out of two circumstances. the fact that New Jersey wanted freight differentials and that the breaking out of the war had brought out the need for a centralized authority to handle traffic in the port of New York. Within the province of the board is 180 miles of shore line, over which territory there are 9,000,000 people. Before the creation of the Port Authority there was no central body to deal with problems of the port. Each interest dealt with matters in his own way. There was no collective mind to study questions that arose.

Mr. Silzer went over the ground very thoroughly. He told about the bridge projects of the board, linking Staten Island and New Jersey, and the proposed crossing of the Hudson River by bridge from Edgewater to uptown New York. He also told about the proposed terminal railroad to intersect all of the present existing carriers in the metropolitan district and disclosed some of the features of the central warehousing plan by which shippers will transport their merchandise to central distributing stations, from which the goods will be reassigned to the particular carrier over whose lines the shipment is intended to be transported.

He spoke about the increase in the interstate bus traffic and indicated the extent to which this traffic would be increased under the stimulus of direct entrance into the city of New York over the proposed new bridges and through the vehicular tunnel under the Hudson

COMING MEETINGS OF *Electric Railway and Allied Associations*

Jan. 6-7—Midwest Electric Railway Association, midwinter meeting, Mayo Hotel, Tulsa, Okla.

Jan. 7—American Electric Railway Association, Metropolitan Section, Engineering Societies Building, New York City, 8 p.m.

Jan. 10-14—American Road Builders' Association, convention and road show, Coliseum, Chicago, Ill.

Jan. 18-19—Kentucky Association of Public Utilities, annual convention, Brown Hotel, Louisville, Ky.

Jan. 25—New York Electric Railway Association, winter meeting. Hotel Commodore, New York City.

Jan. 26-28—Association of Equipment Men—Southern Properties—Memphis, Tenn.

Feb. 3-4—Central Electric Railway Association, winter meeting, Toledo, O., Commodore Perry Hotel.

Feb. 7-10 — American Institute Electrical Engineers, annual convention, Engineering Societies Building, New York City.

Digitized by Google

River. He said that an orderly program for the benefit of the port of New York was now under way and he wandered how long it would be before the people of New York took up the question of local traffic and made a real effort to try to solve it. While he did not say so directly, the tenor of his remarks indicated that Mr. Silzer felt that it would probably be necessary for the Port of New York Authority still further to co-ordinate its activities in the handling of passengers and freight with the activities of the existing carriers in the city of New York.

There was a goodly sprinkling of ladies present at the meeting and despite the technical nature of some of the facts the audience was unusually attentive and apparently very appreciative of the remarks of both speakers.

Automatic and Manually Operated Track Switches*

By P. Battaille
Liége Tramways
and
K. Stoffels
Amsterdam Municipal Tramways

THIS discussion is a continuation of the report of the committee on the same subject at the last convention. Replies from 32 companies indicate that seventeen of them use electric switches and have about 300 in use, and that these switches are taking the place of track switches mechanically operated.

Electric switches are of two kinds, high voltage, or those operated from the trolley circuit, and low voltage, or those in which one rail of the track is insulated and the switch is operated by the current after it has passed through the motors on the cars. The Weenan, Collins, Siemens, and I.E.M. are of the former type and the Battaille, Oerlikon and A.E.G. of the latter type. In the replies to the association questionnaire, emphasis was laid by a number of companies on the need for regular inspection and overhaul of switches. The time spent in their repair per year is estimated by different tramways as follows: Amsterdam, 62 hours; Rotterdam, 52 hours; Zürich, 60 hours; Liége, 70 hours. The railway system reporting the largest number of electrically operated track switches in use was the Amsterdam Tramways with 86.

The committee estimates that if there is a gain of one-half minute in the operation of the car over a switch through the use of electric operation it would pay a railway company to install electric operation where the switch is turned more than twice a day. This conclusion is reached as follows:

Operating expenses per car-day on most railways averages 450 francs, and this sum is equivalent to ½ franc per minute. Then if an electrically operated track switch saves ½ minute for each operation it would have to be used only twice to effect a saving of ½ franc a day. This sum is the average cost of electric switch maintenance, as determined by replies to the data sheet.

*Abstract of paper presented at the bienial meeting of Union Internationale de Tramways, de Chemins de Fer d'Intérêt Local et de Transports Publics Automobiles, Barcelona, Spain, Oct. 10-16, 1926.

Possibility of an Index to Determine the Proper Tramway Fare†

By R. Haerens
Manager Compagnie Belge des Chemins de fer Réunis,
Brussels, Belgium

PRACTICALLY all of the electric railway systems in Europe have been obliged to increase their fares for a number of causes, including the following: A considerable increase in wages due to labor legislation in favor of an eight-hour day; a large increase in the cost of labor and material since the close of the war, and marked reductions in the purchasing power of money. To these reasons are added, in the case of countries with a depreciated currency, the effects of the lower exchange rate.

The result of these conditions has been a practical stoppage in the development of the tramway industry and has suggested the advantages, if possible, of some basis for a sliding scale for fares based on the conditions which experience has shown affect electric railway enterprises. This means, of course, in the case of private companies, that some arrangement must be made with the controlling authorities for a modification of the franchise conditions. Incidentally, it might be said that municipal tramway systems are the exception rather than the rule in the cities of western continental Europe.

Three Principles Recognized in Tramway Franchises

In the grant of tramway franchises in the past, it has been the practice in western Europe for both parties to recognize three definite principles:

1. During the early part of the life of the franchise the company will be building up its traffic and that it depends on the earnings of the latter part of the franchise period to make up the losses incurred during its early life. In consequence, where the franchise includes a clause permitting the municipality to take over the line, the basis during the early part of the franchise is not the earnings of the property, but the investment plus a certain per cent as a bonus.

2. The average franchise usually also includes a statement of the amount of taxes to be paid and often also one specifying a minimum for wages and a maximum for hours of work for the employees.

3. The third point often embodied in a railway franchise is that the municipality reserves the right to share in any very large returns made by the enterprise, though it declines in any way to participate in any loss.

Having considered the principles embodied in tramway franchises in the past, an effort will be made to determine whether it is possible to draft an additional clause by which the rate of fare would vary in proper ratio with changes in wages paid, legal hours of work, cost of power and other operating expenses. A formula to cover the two major factors mentioned will first be considered.

Let:

S = the hourly wage rate, which will be assumed to be 3 francs

E = the cost of electrical energy, which will be assumed to be 0.3 francs per kilowatt-hour

Assume, also, the total wage account = 10,000,000 francs per year and that the total expenses for electrical energy = 1,500,000 francs

Then the fare index (I) to cover these two major items will be:

$$I = S + 1.5\ E$$

In this formula the constant 1.5 has been introduced as a weighting factor to give the two items of expense their proper value. Thus:

$$\frac{S}{1.5E} = \frac{3}{0.3 \times 1.5} = \frac{3}{0.45} = \frac{10{,}000{,}000}{1{,}500{,}000}$$

In other words, the proportion is equal to that of the total itemized expenses already mentioned, or 10,000,000 francs and 1,500,000 francs.

This formula leaves out of consideration the cost of other materials, but experience has shown that they vary practically with hourly wages and electrical energy, so they can be neglected, though where motor buses are used, it would be useful to include a third term based on the cost of rubber tires.

Still another factor is increased taxes. The importance of this has been shown in some cases recently and the franchise should be made to read that the fare be increased in accordance with the increased taxes.

It is true operating expenses are not in absolute ratio with the items of cost mentioned. Thus they are affected by the scheduled rate of speed, extent of car loading and some other factors. The formula mentioned above has therefore its limits. Inclusion in the franchise of a clause covering it will help, but there should also be a general clause granting right of revision of terms to the operating company in case the proposed index does not entirely cover the situation.

†Abstract of paper presented at the bienial meeting of Union Internationale de Tramways, de Chemins de Fer d'Intérêt Local et de Transports Publics Automobiles, Barcelona, Spain, Oct. 10-16, 1926.

American Economic Association to Discuss Regulation

EFFECTIVE public utility regulation will be the subject of one of the most important discussions at the 39th annual meeting of the American Economic Association, to be held at St. Louis, Mo., Dec. 28-31. This will be in the form of a round-table conference in charge of Dr. John Bauer of the American Public Utilities Bureau. Others on the program are Profs. Robert L. Hale and J. C. Bonbright, Columbia University; H. G. Brown, University of Missouri; Martin G. Glaeser, University of Wisconsin, and C. E. McNeill, University of Nebraska.

New Englanders Discuss Snow Fighting

SNOW FIGHTING formed the main topic of the regular monthly meeting of the New England Street Railway Club held Dec. 2 at the Copley Plaza Hotel, Boston, the program being based on the presentation of four practical papers by H. M. Flanders, general manager Springfield Street Railway; N. J. Scott, manager Hartford division the Connecticut Company; W. C. Bolt, superintendent of rolling stock and shops Eastern Massachusetts Street Railway, and E. L. Lockman, assistant engineer of surface lines Boston Elevated Railway. An extended discussion followed the reading of the papers.

President Fred D. Gordon occupied the chair, and after the usual dinner in the evening Albert A. Northrop of Stone & Webster, Inc., Boston, gave an interesting talk on "Power," illustrated by motion picture films. Dean Wallace B. Donham of the Harvard Graduate School of Business Administration, who had been scheduled to address the club on "Business Administration in Street Railway Management," was unable to be present on account of illness. Abstracts of the papers on snow fighting and the discussion that followed will be published in an early issue of this paper.

American Association News

Parking Unanimously Condemned

Police, Railway and Mercantile Interests at Metropolitan Section Meeting Agree on Causes of Congestion in New York

GENERAL agreement concerning the causes of traffic congestion in the streets of New York was voiced by speakers at a meeting of the Metropolitan Section, A.E.R.A., held on Dec. 3 at the Engineering Societies' Building. The viewpoint of the Police Department was explained by William A. Coleman, deputy chief inspector in charge of traffic. W. G. Strait, vice-president New York Railways, presented the operators' side of the case and F. C. Fox, assistant to the president A. I. Namm Company, explained that of the retail merchant. Despite a brisk snowstorm the meeting was well attended.

Inspector Coleman said frankly that parking is the worst problem which faces the traffic division of the Police Department. He called attention to the excellent results accomplished by parking restrictions originally imposed during the subway strike and recently made permanent. An abstract of his talk appears on this page.

The important part played by the surface car and the bus in New York City transportation was brought out by Mr. Strait. He quoted figures showing that the surface car is not of itself a slow vehicle, but is well able to maintain adequate speed when not unduly hampered by other traffic. Mr. Strait's paper appears in abstract elsewhere.

Keen appreciation of the seriousness of the traffic problem was shown in the talk by Mr. Fox. He said that the merchants are partly responsible for the creation of congestion. They have established many large stores in a comparatively small shopping district and they are now beginning to feel the adverse effects of this policy. On account of the difficulty of reaching these downtown stores there is a growing tendency for people to make their purchases at neighborhood stores. He expressed apprehension that this process of decentralization would continue rapidly unless parking was restricted, particularly on streets where car lines operate. In his opinion there are marked economic advantages for the customer in shopping at a large store, and these will be lost if the difficulty of reaching the downtown stores causes people to do their buying locally. Mr. Fox spoke of an insidious propaganda being put forth against the surface car in favor of the bus. He thought that if buses were substituted for cars the public would soon find that the remedy was worse than the disease. An abstract of the talk by Mr. Fox will appear in a future issue.

Prior to the discussion of traffic congestion, A. L. Hodges, secretary Brooklyn City Railroad, gave an interesting account of the recent congress of the National Safety Council and urged all railway men to take a lively interest in the work of this body. The concluding speaker on the program was William S. Hamilton, assistant to the superintendent of transportation Brooklyn City Railroad, who told of changes in operation made with a view to relieving congestion. J. H. Hanna, who was present as a guest, spoke a few words of greeting. Motion pictures taken at the summer meeting of the New York Electric Railway Association at Bluff Point and of the outing of the New York Railroad Club at Pelham Bay Park were shown.

Police Department Finds Parking Most Frequent Cause of Delay*

By W. A. COLEMAN
Deputy Chief Inspector Police Department, New York City

FROM my experience in the Traffic Division, it is my opinion that the greatest obstruction and the most frequent cause of delay to the free movement of traffic is inconsiderate parking. How any citizen who has any regard for the rights of others can drive up with his car in the early morning into a narrow street, possibly with a street car line running through, or on some other busy thoroughfare in a congested business section, and lock it and leave it for six, seven or eight hours, as is often the case, is something I cannot understand and certainly disapprove of. Ten chances to one, whenever or wherever traffic conditions are discussed, you will find this man to be loudest in his denunciation of traffic congestion and asking why the hell something isn't done about it.

It is impossible, with the limited force we have, to stop all unlawful parking. Properly to serve a summons on these long-time parkers means that a patrolman must watch and wait six or seven hours until the owner of the car returns to take it away. This is a waste of police time, but is necessary in order to obtain a conviction in court.

During the recent subway strike the value of preventing parking was amply demonstrated by the emergency regulation which was put into effect at that time and has since been made permanent, prohibiting parking on the most important north and south bound avenues below 59th Street from 7 a.m. to 10 a.m. and from 4 p.m. to 7 p.m. The effect was almost instantaneous. We increased the width of the roadway on these avenues at least 15 ft. over night.

The day on which the strike went into effect traffic practically was at a standstill all of that day. It was impossible to make any time getting up or down town. On the following day, when the emergency regulation went into effect, one could hardly believe such a change was possible; traffic flowed so smoothly there was no congestion; it looked to me like a holiday or Sunday in New York. It proved beyond any doubt that one of the most helpful remedies for relief of our traffic congestion is to put a no parking regulation into effect.

Another obstruction to the movement of traffic is the street cars. Take, for instance, Madison Avenue, where a light control system is in operation. For two minutes traffic is permitted to proceed north and south and one minute east and west. When the green light appears the automobile and the street car proceed; the automobile should in that two minutes cover from twelve to fourteen blocks, but owing to the limited roadway space and parked cars on every block the automobile cannot pass the street car between blocks, and as the street car has to stop every block or two for twenty or thirty seconds at least to permit passengers to alight or to get aboard, the automobile has to stop also. The two minutes allowed very soon expires and the automobile rarely travels more than four or five blocks during the two-minute interval.

Another cause of delay to faster moving traffic is the horse-drawn vehicle. In some cities it is not permitted in certain congested sections. I doubt if any such regulations could be put into effect in this city, but I do believe that considerable of the trucking now being done in the daytime will have to

*Abstract of a paper presented at a meeting of the Metropolitan Section, A.E.R.A., Dec. 3, 1926.

Digitized by Google

be done at night, also that loading and unloading from the side of a vehicle will be made compulsory. If this was done another great obstruction to moving traffic would be removed. Another help would be to have some zoning regulation for business districts. In some buildings in the thirties there is a business conducted on every floor, and the backed-in vehicles completely tie up the street all day.

This congested area extends from 30th to 42d Street, from Fourth to Eighth Avenue. It often takes from 30 to 40 minutes to get across town through some of these streets. We are going to put some restrictive regulation in effect here. We may select two or more crosstown streets in this section and prohibit parking entirely, confine it to one side, or limit parking to twenty minutes, and watch the effect. We have not decided which street to try it out on or when it will be done.

We must, if we are going to permit this constant increase in vehicles, do something to increase the width of our roadways if we expect to keep traffic moving. I think we must eventually double deck some of our streets; we can widen others to at least 34 ft. by reducing the sidewalk widths. Where new roadways are being built and the space is available a width of 80 ft. is the least that should be considered as practicable.

The total registration of motor vehicles in the five boroughs up to and including Nov. 1, 1926, shows there are 589,578 motor vehicles in this city alone; to this must be added thousands of vehicles that come here daily from other parts of the country. How are we going to accommodate this enormous traffic growth to our already overburdened streets is a problem that I am facing with some apprehension, and while I am no alarmist, it looks to me, unless help comes from some source, and comes quickly, we will see traffic completely tied up in certain parts of this city.

Street Cars Travel as Fast as the Traffic*

By W. G. Strait
Vice-President New York Railways

EVERY one is willing to suggest means to solve the traffic problem of the future, but so great is our national reverence for the automobile that few dare to propose a solution for the problem as it now exists. In an interesting interview on this subject, Thomas A. Edison takes a look ahead and tells us that the construction of streets at different levels and the perfection of a helicopter which will enable airplanes to rise and descend vertically will eventually cure our traffic ills. This ought to be good news for the New Yorker of 2026, but it affords small comfort to a citizen of today, marooned in the safety zone at Fifth Avenue and 42d Street. Until we can divert our present traffic to air routes, something must be done to promote a more efficient use of these lanes of travel which are now available. As a matter of simple justice as well as common sense, the rights and well-being of the greatest number of people affected by traffic strangulation ought to receive first consideration.

Surface cars and buses carry 40 per cent of the total number of passengers carried on all transportation lines in Greater New York. Two out of every five residents of New York City, or 1,200,000,000 passengers a year, are subjected to unnecessary inconvenience, delay and annoyance in order that a few thousand owners of automobiles may enjoy the privilege of storing their cars on public thoroughfares—on the property of the public, whose progress to and from their homes is thus retarded.

If such a large proportion of the people of our city use street cars under the present unfavorable conditions surrounding surface travel, how many would use them were adequate traffic restrictions put into effect? Is it not reasonable to assume that such restrictions would bring about a considerable measure of relief from the overcrowding on subway and elevated lines?

Every surface system in the city is equipped to handle a much greater volume of business than it is now able to take care of. With a speeding up of traffic these systems would become important factors in solving the transportation problem. A great deal of short-haul traffic and not a little long-haul traffic have been diverted from the surface carriers to subway and elevated lines, to taxicabs and private automobiles, not because of any failure on the part of the surface lines to provide service, but solely because of conditions beyond their control.

Street cars can travel as fast as the traffic. To prove it I need only give the result of a series of speed checks recently taken on certain lines of the New York Railways system which are most affected by congestion. On Broadway, for example, the schedule running time from 59th Street to South Ferry is 46½ minutes. A southbound car, leaving the northern terminus at 7 a.m., arrived at South Ferry 33½ minutes later, thirteen minutes under schedule. Starting north at 7.38, it arrived at 59th Street in 47½ minutes, one minute over schedule time. Now look at the other side of the picture. A southbound trip, commencing at 3:12 p.m., required 65½ minutes; a northbound trip, starting at 2:04 p.m., required 67 minutes, and another northbound trip, at 4:18 p.m., required 73 minutes to complete. But at 6:25 p.m., when traffic had thinned out and the parked vehicles had disappeared, the same car and crew made the trip in 33 minutes, 13½ minutes under schedule.

It was the same story elsewhere. On the Seventh Avenue-Delancey Street line, where the schedule running time is twenty minutes, the time of trips varied from eighteen minutes in the early morning to 52 minutes in the late afternoon. On Sixth Avenue, with a schedule time of 22½ minutes, an early morning run was completed in 15½ minutes and a late afternoon trip in 39 minutes.

I could furnish similar evidence from each of our eleven lines if it were necessary, but you, as practical transportation men, know as well as I that traffic is the controlling factor in determining how much time is required to carry passengers to their destinations. I might say, incidentally, that the crews on the cars that were checked had no knowledge that a check was being made.

So long as the rights of the traveling public are subordinated to the comfort and convenience of owners of private motor cars, just so long will New York's traffic problem remain unsolved. What it is costing the city in lost time and energy, and in dollars and cents, is beyond computation. The worst of it is that the situation is becoming worse, not only monthly, but daily.

There are 400,000 passenger automobiles registered in Greater New York, to say nothing of the New Jersey, Long Island and Westchester suburbs. If parked close together, they would occupy a street extending from City Hall to Omaha, Neb., but most of them seem to be trying to find parking space south of 59th Street. That is why the Manhattan Surface Line Operators' Traffic Committee seeks the abolition of parking in that section.

Every well-informed, unbiased student of the traffic problem realizes that the remedy lies in discouraging the use in congested sections of the inefficient carrier and encouraging the efficient carrier—the one which transports the most people while utilizing the least amount of roadway space. At present the reverse of this principle is being applied.

Must Convince the Merchants

Parking prohibitions will not only have the effect of opening up new lanes of travel, but will also discourage the use of the inefficient carrier—the one hauling, on an average, $1\frac{7}{10}$ passengers—in the more congested sections, where these prohibitions are applied.

The only reason why practically unrestricted parking is permitted is that certain shortsighted merchants have been able to exert a potent influence in favor of the practice. In their eagerness to encourage the parking of cars in front of their stores they forget that they are making these stores inaccessible to other potential customers who travel in private cars, in taxicabs, in street cars and in buses.

The practical transportation men of New York City must combat this fallacious view. If possible, they must convince the merchants of the desirability of prohibiting unnecessary parking, but whether or not they can do this they must convince the proper authorities that it ought to be done because public interest demands it. Every legitimate influence that can be exerted upon public opinion and city officials ought to be exerted to bring about the desired result. Each of us can help as individuals and also as representatives of a vital industry. We owe this much to

*Abstract of a paper presented at a meeting of the Metropolitan Section, A.E.R.A., Dec. 3, 1926.

Digitized by Google

ourselves, to the thousands of people who constitute the ownership of these properties and to our patrons.

Members Elected

MEMBERSHIP was voted to two operating electric railway companies, eleven manufacturing companies and six individuals at the meeting of the executive committee of the American Electric Railway Association held Nov. 19. Following is a list of the new company members:

OPERATING COMPANIES

Chicago, South Shore & South Bend Railroad, Michigan City, Ind.

Newport & Providence Railway, Newport, R. I.

MANUFACTURER COMPANIES

Ferodo and Asbestos Incorporated, New Brunswick, N. J.

Fremont Metal Body Company, Fremont, Ohio.

Hunt Spiller Manufacturing Corporation, South Boston, Mass.

Kelly-Springfield Tire Company, New York, N. Y.

McJunkin Advertising Company, Chicago, Ill.

Meyer & Wenthe, Chicago, Ill.

The New Departure Manufacturing Company, Bristol, Conn.

The Northern Granite & Stone Company, Cleveland, Ohio.

Phillips Petroleum Company, Bartlesville, Okla.

The Seiberling Rubber Company, Akron, Ohio.

Truscon Steel Company, Youngstown, Ohio.

Power Transmission and Distribution

ORGANIZATION of sub-committees and outlining of work to be undertaken filled a two-day meeting of the power transmission and distribution committee of the Engineering Association held in New York Dec. 2 and 3. Members present were F. McVittie, chairman; J. W. Allen, M. W. Cooke, J. H. Drew, S. S. Hertz, A. J. Klatte, H. S. Murphy, J. F. Neild, W. J. Quinn, M. B. Rosevear, W. Schaake, A. Schlesinger, D. L. Smith and R. E. Wade. J. C. Daiman represented W. H. Bassett and E. D. O'Neill represented C. L. Hancock.

It was decided to hold the next meeting of the committee in Chicago, March 7 and 8. In order to conform with the action taken at the last convention regarding specifications for steel tubular poles, it was agreed to remove from specification D202-16 all reference to tubular steel poles beginning on page 332 of the Manual, including the text and tables on pages 342 and 343. A paragraph was agreed upon which is to be inserted in place of the matter removed. It was also agreed to remove section D202-25 from the Manual and include the specifications as approved by the American Engineering Standards Committee in place of it.

Improvement of the wireograph, which is used for making measurements of trolley wire, was discussed and it was decided that the chairman of sub-committee No. 3 should place before the Bureau of Standards and also before several universities the question of making an analysis of the principles of this instrument to include suggestions for correcting errors which now exist.

The question of pole reinforcement as a means of avoiding replacement of depreciated poles was discussed and results of experiments being made in Chicago and on the Third Avenue Railway in New York were given.

Work of the various sub-committees was started by meetings which were held Dec. 3. Sub-committee No. 1, which is to review existing Manual sections, went over all the present sections relating to power transmission and distribution and decided on the ones which would receive detailed consideration. The sub-committee on this subject consists of J. W. Allen, chairman; J. H. Drew, S. S. Hertz, K. J. Keith, John Leisenring, W. J. Quinn, M. B. Rosevear, W. Schaake, A. Schlesinger and R. E. Wade.

Study of specifications for materials used in catenary construction will be continued by sub-committee No. 2. Recommendations of the 1926 committee were gone over in detail and many points were cleared up. The sub-committee on this subject consists of D. L. Smith, chairman; S. H. Anderson, W. H. Bassett, J. H. Drew, S. S. Hertz, John Leisenring, M. B. Rosevear, W. Schaake, A. Schlesinger and R. E. Wade.

Trolley wire wear and breaks will be studied further by sub-committee No. 3, which will endeavor to clear up disputed points regarding the accuracy of the wireograph. The sub-committee consists of H. S. Murphy, chairman; J. W. Allen, S. H. Anderson, W. H. Bassett, M. W. Cooke, J. H. Drew, C. L. Hancock, A. J. Klatte, J. F. Neild, M. B. Rosevear and G. F. Wennagel.

Sub-committee No. 4 will continue to confer with the American Society for Testing Materials in an effort to improve the specifications for bronze trolley wire. Discussion of this subject showed that there is a tendency for closer agreement on the twist test which has been under discussion. The personnel of the sub-committee is: H. S. Murphy, chairman; J. W. Allen, W. H Bassett, M. W. Cooke, C. L. Hancock, A. J. Klatte, J. F. Neild, M. B. Rosevear and G. F. Wennagel.

Investigation of radio interference will be continued by sub-committee No. 5 and this committee will be very glad to receive any reports of experience and conditions from any member of the association who is having problems to solve. The sub-committee inc'udes W. J. Quinn, chairman; S. H. Anderson and D. D. Ewing.

Inductive co-ordination will be studied and sub-committee No. 6 will endeavor to maintain contact with the American committee on inductive coordination. The sub-committee on this includes J. F. Neild, chairman, together with D. D. Ewing and A. Schlesinger.

A new subject is being considered by sub-committee No. 7. This is a layout designed for the distribution system of automatic substations. It was agreed that information should be gathered to form a definite basis for the development of such a system. This information will be obtained from the principal manufacturers, together with engineers who have automatic substations. The sub-committee consists of G. F. Wennagel, chairman; D. D. Ewing, J. Leisenring, W. Schaake, A. Schlesinger, D. L. Smith and R. E. Wade.

The advisability and possibility of establishing a standard by which various methods of operating and maintaining overhead lines can be compared was considered by sub-committee No. 8 Discussion brought out that many variables must be considered and the sub-committee will try to formulate some recommendations to take care of various conditions. The sub-committee includes M. W. Cooke, chairman; K. J Keith, A. J. Klatte, H. S. Murphy, J. F. Neild and W. J. Quinn.

Standardization of trolley wire reels is a new subject being undertaken by sub-committee No. 9. Discussion of this showed that all felt very definite recommendations should be made. Designs for standard reels will be worked out and will be submitted to all manufacturers of trolley wire in an endeavor to secure agreement. The sub-committee includes J. F. Neild, chairman; W. H. Bassett, C. L. Hancock, S. S. Hertz, K. J. Keith, A. J. Klatte and D. L. Smith.

Wood Preservation

SUB-COMMITTEE assignments and subjects to be studied during the present year were discussed at a meeting of the committee on wood preservation held at New York on Dec. 8, 1926. It was decided to drop some of the topics considered by the committee last year and to concentrate on others. A special attempt will be made to present data in the committee's report showing the economic advantages of treating timber. Those present were: C. A. Smith, chairman; A. P. Way, W. L. Harwood, E. F. Hartman, E. H. Swayze, W. H. Fulweiler and R H. White, Jr.

Manufacturers' Committee to Expand Activity

IN A MEETING of the committee on co-operation of manufacturers held at association headquarters on Dec. 6 suggestions for broadening the scope of the committee's activity were made. During recent years, this committee's work has consisted principally of co-operation with the publicity committee for the purpose of enlisting the support of manufacturers in presenting the railway situation to the public.

The plan for broadening the committee's functions would extend its activities to other things. The thought was expressed that this might ultimately result in making the committee a clearing house for presenting to the executive committee the collective views of manufacturers. Suggestions made in a letter by M. B. Lambert, transportation sales manager Westinghouse Electric & Manufacturing Company, for setting up a regional organization of the committee which could be made the means of stimulating interest on the part of all manufacturer representatives in the subject of improved equipment were discussed at length. Suggested names for such regional appointments were made to Chairman Wickwire. Other activities in which such a regional organization would make possible greater co-operation by manufacturers in promoting the interests of the electric railway industry were outlined and discussed.

The News of the Industry

Temporary Extension on the Way

Recent Moves at Chicago Indicate Respite for Surface Lines—Rumors of Bus Service with 4,300 Vehicles

Because it is regarded as the only temporary solution of the traction problem possible; because it would give the Legislature time to pass laws permitting the incorporation of such features as terminable permits and unified transit in the new franchises, and because it would protect the interests of the city during the impending receivership, the transportation committee of Council of Chicago voted almost unanimously on Dec. 8 to recommend to the Council that it extend the Surface Lines franchises for six months until July 1, 1927. The lone Alderman who protested said that the city should not put itself on record before the companies signify whether or not they will accept the offer.

A resolution outlining the terms of such a grant had been previously prepared by Corporation Counsel Francis X. Busch at the instance of the local transportation committee and Mayor William E. Dever, who first urged the extension two weeks ago. In commenting on the proposal Mr. Busch asserted that it was unlikely the grant would prevent a receivership.

City-Wide Bus Proposal Submitted

Rumors that the Chicago Motor Coach Company was prepared to offer a city-wide bus service to the city were set at rest on Dec. 8. On that date J. A. Ritchie, president of the company, addressed to Mayor Dever and the Council a letter in which he said that "we propose giving Chicago a complete installation of modern double-deck motor coaches serving not only the people now served by the Surface Lines, but extending the installation to localities at present without any service." He said the art of motor coach design and construction has developed to the point where mass transportation can be adequately handled by the motor coach.

According to him the modern large capacity coach is a more efficient carrier than the street car, due to the marked improvement in construction in recent years. On the other hand "there has been little progress in recent years in street railway systems." His company proposed to furnish "a sufficient number of motor coaches so that during rush hours there would be available 290,000 seats as compared with 156,000 now provided by the Surface Lines."

The total capital investment for the proposed city-wide motor coach operation in Chicago is estimated by him at less than one-half of the present value of the Surface Lines as reported by the Board of Supervising Engineers. The length of the average ride per passenger on the Surface Lines in Chicago, Mr. Ritchie says, is about 4 miles. On the present motor coach system, operating largely on the boulevards, the average ride per passenger is about 6 miles.

Mr. Ritchie expressed the opinion that notwithstanding the case now pending in the Supreme Court of Illinois between the city and his company, involving certain legal questions, and having in mind the importance to the city of Chicago of an early settlement of its surface transportation problem, an agreement could be entered into between his company and the city which would bring about a prompt solution of the problem. He said the agreement would be binding on the city and his company no matter which side is successful in the pending litigation.

Mr. Ritchie says the interests he represents desire to confer with the city authorities to work out a plan which will meet with public favor. According to him the subject of fares, period of contract, compensation for the use of the streets, etc., have all received careful attention by his company.

$20,000,000 Interurban Extension Authorized

Immediate construction of a connecting link of the Piedmont & Northern Railway between Spartanburg, S. C., and Gastonia, N. C., a distance of 55 miles, was authorized by stockholders of the railway at a meeting in Greenville, S. C., on Dec. 8. The action of the stockholders ratified a proposal of the board of directors made about a month ago. A resolution adopted by the stockholders also authorized the directors to proceed as they see fit with extension of the Piedmont & Northern lines north from Charlotte, N. C., to Durham, N. C., with such branch lines and along such route as the directors may see fit.

This is a distance of about 135 miles, and when this second addition is completed the rich cotton belt of South Carolina and the tobacco growing section of North Carolina will be connected with a continuous electric railway. Extension of the Piedmont & Northern lines, which will ultimately represent an expenditure of about $15,000,000 or $20,000,000, will be financed by stock sales and bond issues according to the judgment of the board of directors. With this action of the stockholders in ratifying the proposal the matter now reverts back to the directors, who are instructed to enter into any contracts or agreements that they deem advisable in pushing to completion the extension.

Work on the extension of tracks from Spartanburg to Gastonia will begin as soon as legal and financial details can be worked out so that the tracks will be ready for the operation of trains within about one year.

L. J. DeLamarter Nominated for Civic Prize

Louis J. DeLamarter, vice-president and general manager of the Grand Rapids Railway, Grand Rapids, Mich., has been named by the Association of Commerce of that city as candidate for the $1,000 award offered by the Harmon Foundation of New York to the person responsible for the most outstanding civic achievement for the year.

Mr. DeLamarter merits consideration for the honor because of his contribution to the progress of railway service with the new cars that have brought Grand Rapids renown in that field.

Inquiries indicating interest in the Grand Rapids treatment of its railway problem have come from all over the country, says Lee H. Bierce, secretary of the Association of Commerce.

The chairman of the award jury is Julian W. Mack, judge of the United States District Court at New York. Other members of the jury are Jane Addams of Hull House, Chicago; Will W. Alexander, director of the Commission on Inter-Racial Co-operation, Atlanta; Mary S. Gibson, Los Angeles, and Rev. John A. Ryan, director of the National Catholic Welfare Council, Washington, D. C.

The award is not competitive in a literal sense. While nominations are invited, the judges are not restricted to a choice from among nominees.

New Corporation Would Operate in Michigan

The Rapid Transit Corporation of America, incorporated under the laws of the State of Delaware, which has taken over the Michigan Elevated Railway Corporation and the Detroit Elevated Corporation, still in the promotion stage, has applied to the Michigan Public Utilities Commission for permission to do business in Michigan.

It is proposed to construct a monorail line from South Park, near Port Huron, Mich., to Detroit. Officials of the company announce that financing of the line is assured.

Officers of the corporation include C. M. Goodrich, K. Vedder, William O. Fitzgerald, George A. Schwab, Dr. J. C. Walker and Fred Rohnert.

Labert St. Clair Recovering

Labert St. Clair, director advertising section of the American Electric Railway Association, is convalescing at his home in Rye, N. Y., from the effects of an operation to which he submitted shortly after his return to New York from the convention at Cleveland.

St. Petersburg Municipal Line Goes to 7-Cent Fare

Seven cents is now being charged in St. Petersburg, Fla., on the lines of the Municipal Railway of St. Petersburg. The old fare was 5 cents. The increase, effective on Dec. 1, was recommended by R. E. Ludwig, director of public utilities, and was approved by the City Commission.

Steady decreases in the total receipts from passengers were ascribed as the main reason for a higher fare. Railway receipts in October fell off 10 per cent compared with a similar month last year, and November, according to Director Ludwig, is 15 per cent below November, 1925. In addition, the company has been called upon to pay for large improvements out of the operating funds.

With a fare of 7 cents, sixteen car tokens are to be sold for $1 and the special rates for school children will remain. The two-zone system within the city has been abandoned, reducing the regular fare to the Jungle and Shore Acres from 10 to 7 cents. Although the increased rate applies only to St. Petersburg, it was intimated that the question of an increase from 10 to 14 cents for Gulfport would be taken up with the Town Council of Gulfport and the Florida Railroad Commission.

Commissioner Charles L. Snyder said that in his opinion the municipality should not operate a public utility at a loss. He explained that the city should not charge taxpayers who do not ride the street cars for the deficit caused by the riding public. He said the increased fare was a temporary measure taken to tide the municipal railway over until the city was relieved of the extra burden of expenditures brought about this year by extensions to the railway and losses suffered by operation of a municipal bus line. City Commissioner Serviss explained that buses were now paying their own way.

Boston Committee Contemplates Extensions

A special commission, created by the Legislature last year, has made several recommendations to the new Legislature regarding rapid transit in Boston. These include an extension of the rapid transit system from Governor Square to permit Boylston Street trains to go farther west; a subway station at the corner of Charles and Cambridge Streets; an extension of the East Boston tunnel again, running it from Maverick Square in East Boston out to Day Square, and an extension of the Elevated service beyond the Everett station.

The commission reports against the proposition to scrap the Boston Elevated structure in Charlestown and in Washington Street, Boston, as unwise and uneconomical, but it concludes that the city of Boston might buy the elevated structure. Such purchase would not be different from the state's purchase of the Cambridge subway, and the ownership of it by the city would be like its ownership of the subways and tunnels in Boston. It would relieve the Elevated of a burden and permit of the construction of other improvements when needed. If the elevated structure were owned by the city and a rental of 6 per cent were charged the railway, the annual rent would amount to $1,800,000 and the purchase price load would be paid from the sinking fund. This would be about $27,000,000. If the purchase money cost the city 4 per cent to borrow, the debt would be paid in 27 years, from the sinking fund accumulation.

The commission which makes these recommendations is composed of Chairman Attwill of the Public Utilities Commission, Stanley R. Miller of the board of trustees of the Boston Elevated Railway and Col. Thomas H. Sullivan, chairman of the Boston Transit Commission.

Wage Increase in Pittsburgh Proposed

The trainmen and the management of the Pittsburgh Railways, Pittsburgh, Pa., have approached the Traction Conference Board with a view to increasing the rate of pay of trainmen 1½ cents per hour, effective Jan. 1, 1927. It is believed that although the present agreement between the company and the trainmen does not expire until May 1, 1928, this move is economically sound because of the splendid co-operation rendered to the company and the public during the past year, and because of the many economies the men instituted or aided to put into effect.

A poll of the members of the Traction Conference Board indicates that they would agree to the proposition, but action cannot be taken officially until the railway budget for 1927 is presented.

Wheeling Favors Revised Franchise

The proposed revised franchise of the Wheeling Traction Company, Wheeling, W. Va., has been generally received with favor by representative citizens as a result of a joint citizen-Council meeting. The suggestions were also favorably received by A. C. Spurr, general manager of the company. He informed the Council and the citizens that the revision was not being sought because of the assumed operation of the Mozart Park line but because it was necessary to ask for relief; that the company was operating in Wheeling under antiquated franchises, and that many cities and a few states had through legislation relieved the railways of obligations similar to those that exist in Wheeling.

Clauses demanding frequent and efficient service, as well as safety for patrons of the line, will be inserted in the proposed franchise before conclusive steps are taken. The fare is not to be more than any zone fare in the city. In this way the city will receive adequate compensation for relieving the company of surface paving conditions. In exchange for the relief obtained through revision the Wheeling Traction Company will expend $65,000 in rehabilitating the line.

Seeks Higher Rates in Norfolk But Not Richmond

Substantial increases in rates on its Norfolk, Va., division are asked by the Virginia Electric & Power Company in a petition just filed with the Virginia Corporation Commission. The case will be heard on Dec. 16. The company asks a cash fare of 10 cents, with three tokens for 25 cents and weekly passes at $1.50, the passes to entitle bearer to ride the company's cars or buses at will during the seven-day period. School tickets will be 24 for $1, if the petition is granted. Under the new schedule free transfers will be granted between street cars and buses on the division and all zones will be abolished. The company asks that the new rates and provisions become effective Jan. 1.

The City Council of Norfolk has petitioned the State Corporation Commission to grant the company the new schedule. The latter has agreed to rerout its lines in accordance with recommendations of a recent commission which investigated the traffic situation in Norfolk for the city government. It is claimed by the company that it is making at present only 2 per cent on its properties in the Norfolk division.

In connection with the desired increase in fares in Norfolk, Mr. Wood said that the company felt honor bound, not to ask for an increase in Richmond for at least a year. In that city the company was not now making the 8 per cent on its investment to which it was entitled under the law. The company hoped, however, that the new bus routes and the railway extensions under the new franchise would make up the revenue.

He pointed out that Norfolk now has three fare zones, operative particularly on the line through the city to Ocean View and Willoughby Spit, and that the new fare would do away with zones entirely. He also said that the new fare was based on extensive rerouting and other plans recommended by a traffic commission. Only about 5 per cent of the users of the Norfolk system would pay the 10-cent fare under the new rates, Mr. Wood said statistics would show. The other 95 per cent would either ride on the tokens, which will be procurable for 8½ cents, or use a weekly pass, which was to be transferable and would cost $1.50.

Improvements to Be Made by Inland Empire

Ralph Budd, president of the Great Northern Railway, says that if the purchase of the Spokane & Eastern Railway & Power Company and the Inland Empire Railroad by his company is approved by the Interstate Commerce Commission extensive improvements will be made during 1927 on the lines purchased. The properties to be taken over operate from Spokane to Cœur d'Alene, Idaho, and from Spokane through the Palouse wheat district to Moscow, Idaho. The Inland Terminal building and grounds will be leased or sold when physical connections are made between the two systems, permitting the Great Northern depot to be used by the electric lines.

New York May Do Something About It

Public Interest Has Recently Become Aroused Over the Direction in Which New York City Is Headed in a $1,000,000,000 Expenditure for Rapid Transit Lines Intended to Be Municipally Operated, but Which Must, After an Experimental Period of Three Years, Be Run at a Fare that Will Cover Costs—Unification with Existing Lines Suggested—Some Angles of the Situation Reviewed

SOBER attention is being focused on the transit situation in New York. Not since the negotiations of the so-called dual subway contracts of 1913 has the transit matter been so much in the public prints as has been the case in the last few weeks. Many circumstances have worked to this end. The agitation about the pending bus contracts has been consistent. The matter has become a public issue by the attitude of Comptroller Berry. The transit companies, notably the Brooklyn-Manhattan Company, have issued several statements, among them an opinion by Charles E. Hughes that it would do the city no good to attempt to write into the pending bus contracts stipulations seeking to fix the fares. Coupled with all this has been agitation about a revival of the plan for the unification of all the local systems. This last would involve the ditching of the dual contracts, so called, under which the subways are now operated, and the making of new contracts in which the 5-cent fare, according to Chairman Delaney of the New York City Board of Transportation, would not be a primary consideration.

It is impossible to go into all the political angles of the matter. It should be said, however, that a large part of the credit for having raised the subject of transit as an issue is due to Comptroller Berry. He insists that the matter of subway financing overshadows all other questions of city finance and says there can be really no determination of other pending problems until the subway question has been settled. Mr. Berry is not committed to any particular plan, but he has declared emphatically that he cannot see how the city can go ahead with any of its other projects until this question has been disposed of. He favors the immediate appointment of a board of expert engineers to examine the proposed plans before further expenditures are made on the system now under construction.

Municipal System Under Construction

Right here it should be explained that the city of New York is committed at the present time to the construction of a system of rapid transit lines, intended to be run by the municipality itself, estimated to cost $625,000,000. Mr. Berry and others, many of them experts in matters of this kind, say the cost of this system may run as high as $1,000,000,000. In order to complete the system by 1931 the estimated money requirements from 1925 and 1926 were set down at $238,000,000. To date only $94,605,157 has been appropriated. Critics of the program of transit construction to which the city is committed say that even this inadequate amount of more than $90,000,000 has been secured only by neglecting other important municipal improvements. By legislative act the proposed city system will be compelled to operate at a 5-cent fare for the first three years. After that service will be at cost. As a consequence the losses for this period, according to estimates made by the Board of Transportation, will be $61,994,800. According to Mr. Berry, the city's present annual deficit on its non-earning investment in the existing rapid transit facilities is $13,845,000. As critics of the present program see it, the competitive operation of the city system will not accelerate the date when the city will receive a return on its investment in the existing rapid transit system, publicly owned but privately operated.

Alarm expressed by Mr. Berry at the situation as it now stands is shared by the Real Estate Board of New York City, which feels that the present subway program threatens the financial stability of the entire city. Lawrence B. Elliman, chairman of this board, stated recently that the billion-dollar program developed during the Hylan régime, and generally indorsed by Mayor Walker, will bring the city's debt up nearly 50 per cent, to the unheard of value of 25 per cent of the assessed value of New York City's taxable property. According to Mr. Elliman, confusion and bankruptcy seem inevitable for the city.

A Matter for Technical Rather than Political Attention

The natural reaction to that thought is that the greatest care must be exercised to develop systems with economy and foresight and to operate them so that they will be the least possible burden on the public. According to Mr. Elliman the New York public has been unmoved by the traction situation that has been skidding along on the brink of despair for so many years. As he sees it, the solution of the matter is largely in the hands of men elected to public office untrained in the technic of transportation and that the matter too frequently receives such casual treatment as was meted out to it by Mayor Walker when he said, confidently, that he "knew this traction thing would turn out all right."

According to Mr. Elliman the baffling problem is not engineering or even financing but discovering some way to engage the public attention long enough to obtain public understanding of the situation. The financial condition of railways had but little effect on the public, but he thought it would be interesting to see if the possible fear of bankruptcy of the city of New York itself would prove to be sufficiently vital to the people themselves to cause New Yorkers to pause for a moment in their mad rush to contemplate the direction in which the $1,000,000,000 municipal subway scheme was heading them. If their attention could be arrested, then perhaps the public would demand that technical rather than political attention be given to this most threatening problem.

But the rapid transit matter, as such, is not the only problem. Tied in with it is the subject of granting bus franchises. Here again concern is expressed for the future outlook. The committee on city transit of the Merchants' Association has expressed its appreciation of the estimates and facts contained in the report by the Board of Transportation relating to the various routes proposed, but the committee has indicated that it is unable to agree on the policy recommended by the board in that it (1) disregards the principle of unification and economic utilization of existing means of transportation and (2) fails to consider the property rights of companies now operating. It says that it is in the interest of all the people of New York City that this ques-

Some of the Reasons for the Commotion

NEW YORK CITY is engaged on a program for the construction of subways intended to be operated by the city estimated by its proponents to cost $625,000,000. Other estimates of the probable cost place the sum at more than $1,000,000,000.

Real alarm is now being sounded by business bodies at the probable effect of all this on the credit of the city. These are some of the reasons for that alarm: So far contracts to the extent of about $100,000,000 have been awarded. In order to complete the system by 1931 estimated money requirements for 1925 and 1926 were set down at $238,000,000.

Mayor Walker has said that he "knew this traction thing would turn out all right." Comptroller Berry isn't so sure about it. As for Chairman Delaney of the Board of Transportation, he has recently had something significant to say on the matter of unification to include the existing carriers. Still more recently Chairman Dahl of the B.-M.T. has made public letters discussing the prospects.

Digitized by Google

tion shall be settled along sound economic lines. It wants the public clearly informed that any attempt to develop a city-wide system of independent bus operation is a distinct movement away from the principle of unification. The committee agrees with the principle of the proposals before the Board of Estimate and Apportionment, the law-making body of the city, which provides for a zone system of fares on the proposed bus lines with a 5-cent charge for shorter hauls and higher charges for long hauls, but it says that it clearly recognizes that for longer distances in less congested sections it is impossible for buses to operate profitably at a straight 5-cent fare.

Why the Discrimination?

It contrasts this situation with the one under which present surface railways are forced to operate at a 5-cent fare, irrespective of distance, even though the actual cost of transportation on these lines is in most cases considerably in excess of 5 cents. It says that any further attempt to introduce competing bus routes would still further deplete the earnings of the surface lines and render more complicated the present transit situation. Its idea is that the existing transportation carriers should be encouraged to develop bus lines within their territories as auxiliaries and feeders, whenever circumstances render such action desirable or practicable. It says that any other method of handling the question of surface transportation will merely lead to increased costs and further complications which would inevitably postpone a solution of the transit problem in New York.

In a communication to the Mayor, the Merchants' Association contends that the plan of the Board of Transportation for a large number of segregated bus systems is economically unsound and adverse to the public interests. The association says that the plan should be abandoned and in place of the proposed fifteen unrelated systems in competition both with trolley and subway systems, there should be substituted four large systems based upon the principal existing facilities and fully correlated with such new bus lines as are required to meet the public needs fully.

A Bit of Bus Background

In contemplating this situation in its various aspects the tendency of the narrator unmistakably is to go too fast. It should, perhaps, be explained at this point that the proposal to issue franchises for additional bus routes in the city has been in the offing for many months past. Mayor Hylan, when he was in office, kept promising to do something about the matter, and Mayor Walker, who succeeded Mayor Hylan on Jan. 1 last, took up the talking where his predecessor had left off. Report has followed report on this matter, but there has as yet been no action. As late as Sept. 15 the Board of Transportation submitted a 1,088-page finding to a special meeting of the Board of Estimate on the proposal to award bus franchises to private corporations. The substance of the recommendations of the board was that the franchise be awarded only to a corporation of great financial ability and for city-wide operation only; that there be strict adherence to the 5-cent fare principle with a possible charge of 2 cents for transfers. On the basis of the present bids, the Board of Transportation indicated that the offer of the Equitable Coach Company was the most favorable in that it was the only one that came anywhere near meeting the rigid conditions set down. The way was left open, however, for further negotiations with other concerns eager to enter the bus transportation field. This report was referred to the committee of the whole of the Board of Estimate, without comment and there it has rested since, without action.

There has been a veritable avalanche of bus bids. In one form or another the proposals now exceed 100 in number. The local railways have expressed their willingness to run buses, and all the principal ones have made bids for the right to operate. Among these applicants is the C. I. & G. Bus Corporation, subsidiary of the Brooklyn-Manhattan Transit Corporation, and of the Brooklyn City Railroad. The proposal made in behalf of this company contemplates operation on a service-at-cost basis. In the hope that it will be useful in the final solution of the relief that can be afforded to transit and traffic conditions by auxiliary bus service, Gerhard M. Dahl, chairman of the Brooklyn-Manhattan Transit Corporation, has sent to the Board of Estimate and Apportionment a communication dealing with the fare conditions contemplated for inclusion in the bus franchises. Mr. Dahl's concern is with the reiteration of the statement made publicly about a 5-cent fare. The proposed form of franchise suggested by the Board of Transportation recommends that such fixed fare on each route or zone shall be 5 cents.

Similar statements by public officials have caused general public belief that the bus fare will thereafter be 5 cents. The question that arose in the minds of some was whether the city had the power to compel a fixed fare and to require the grantee of bus franchises to abide thereby, beyond state power to fix a reasonable fare higher or lower than such fixed fare. It was Mr. Dahl's thought that if the city does not have such power, the situation should be so thoroughly understood that the public will not be misled by repeated statements that all applications must be on a 5-cent basis, with consideration given only to other favorable conditions of proposed offers and with the final claim that the bus situation has been successfully "solved" on a "5-cent fare" basis. The position of the company which Mr. Dahl represents is that cost-of-service is the legal and sound basis upon which the city should consider the granting of bus franchises. It further believed that any effort to impose an arbitrary fixed fare was lacking in candor to the public in the light of the legal situation controlling the granting of franchises.

Here, indeed, was a mighty serious situation. If the city did not have the actual power to fix fares, the public would, by such claim, be further deluded for a time on the economic principles controlling permanent transportation service. Furthermore, any applicant with a knowledge of the possible limited power of the city to fix fares could afford to go far in its offer of routes, service and other matters. Thereafter, if it were granted franchises on such an apparently liberal offer, it could secure, by proper proceedings, the fixing of fares at the then cost of service. In order that the questions about fare fixation should be made as clear as possible, Mr. Dahl's company asked Charles E. Hughes to consider the matter and to express his opinion thereon. It will be recalled that the Public Service Commission law was passed when Mr. Hughes was Governor of the State of New York. Mr. Dahl on Dec. 1 transmitted to the Board of Estimate a copy of Mr. Hughes' opinion for its consideration. The question submitted to Mr. Hughes was:

"Would a bus franchise granted under the form of contract proposed in the second report of the Board of Transportation enable the city to terminate the franchise in case an increased rate of fare were charged under the authority of the Transit Commission?"

The opinion by Mr. Hughes is one of some fifteen pages.

The Senegambian in the Woodpile

Stated in other words, the question was whether the city, in granting a bus franchise, has authority to contract with the grantees that the latter shall not avail themselves of the exercise of the rate-making power vested in the Transit Commission. Mr. Hughes concludes that any attempt to create a contractual obligation on the part of the carrier to charge a fare which the Transit Commission finds to be unjust and unreasonable, or not to charge a fare which that commission finds to be just and reasonable, in the exercise of its jurisdiction under Sec. 49 of the public service commission law, would be abortive and that a stipulation to that end in the grant of the franchise would be null and void. Mr. Hughes says that the provisions of the public service commission law must be taken as read into the franchise, and the provisions of

Lessons in Subway Finance

GERHARD M. DAHL, chairman of the Brooklyn-Manhattan Transit Corporation, is engaged in writing a series of letters to New York City's Transit Commission and Board of Estimate which should, when the final one is drafted, be gathered together in a textbook for use by rising politicians. It is probably too late to teach the older generation of Tammany that no way exists for making a nickel buy as much transportation as it did a dozen years ago. They will live and die without discovering the truth, not because they are unable to grasp it but for the reason that they do not want to. But light will gradually break into the younger Tammany mind, and Mr. Dahl's letters are helping. — *Wall Street News.*

Digitized by Google

that law contemplate the exercise of authority over fares or other rates on the part of the commission. And the Transit Commission, as the successor to the Public Service Commission for the first district of New York, is a creature of the state. There apparently is the Senegambian in the woodpile.

The first reaction in official city circles to this expression of opinion by Mr. Hughes was that further delay might result in the granting of the bus franchises. Mayor Walker was inclined to believe, despite the opinion of Mr. Hughes, that the provision in the proposed franchises which fixed the fares at 5 cents and binds the franchise holder not to appeal to the Transit Commission or to the courts for a higher fare, on the penalty of the forfeiture of the franchise, was legally binding. His idea was that if this were not the case, the law should be amended to give the city the power to make supervision of this kind binding.

Mr. Delaney, the chairman of the Board of Transportation, raised the point that if Judge Hughes were correct in the views that he held, the alternative would seem to be municipal operation. The city, however, would need legislation to empower it to operate a bus system and Mr. Delaney said that any franchise granted in the meantime should be for the shortest period possible and that any attempt by a franchise holder to increase the fare in accordance with Mr. Hughes' opinion should be tested in the courts.

Discussion of Unification Started

While all this was going on, informal discussions were held by the Board of Transportation with railway representatives on the matter of the possible unification somewhat in keeping with the suggestions contained in the plan advanced by the Public Service Commission about five years ago. This plan, it is understood, contemplates the formation of a new semi-public corporation, the only outstanding securities of which would be a small issue of stock so allocated between the two groups as to divide control evenly between the public and private interests. This corporation would take over from the public and from the city operating rights, but not the ownership of any property. It would assume the active management of all lines involved in the consolidation and run them as a unit in the interests of the traveling public. All of the subways and all of the elevated lines of the city, both those now in existence and the city lines under construction, and such other transit lines as would be vital to the city, would be under its control.

Thus the matter quickly became one for public discussion. All of the newspapers took it up according to their lights and leanings; the Transit Commission issued a statement of its position in the matter; Mr. Dahl of the Brooklyn company made the position of his company plain in several statements addressed to the Board of Estimate and Apportionment and the Transit Commission, and Frank Hedley, president and general manager of the Interborough Rapid Transit Company, also stated the position of his company.

The statement made by Mr. Delaney looking toward possible unification was presaged upon events at the conferences held with transit officials some time ago. These conferences were to have been resumed about July 1. The strike on the lines of the Interborough and other important matters delayed things, and the Mayor has not yet called the conference to reconvene. This conference, when it is reconvened, members of the Transit Commission expect to attend. The commission made it plain that in accordance with its desire to co-operate as much as possible with the city authorities, its policy has been in all cases to lend its friendly offices in the hope that an agreement can be reached between the city and the transportation interests, the expectation being that progress can be made in this way much faster than by formal proceedings.

The Stage Is Set for Action

EVEN the public authorities have been at outs with each other. Up to the first of last May the city administration would have no truckling with the State Transit Commission. First of all, the commissioners were Republican appointees. Then, too, Mayor Hylan conceived a bitter animosity for the chairman, George McAneny. The most friendly personal feeling existed between the Transit Commission (state) and Mr. Delaney's Board of Transportation (city), but only the most informal sort of co-operation was possible between them in such a rough set of partisan politics and personal feeling. Up to the first of January any constructive solution of the transit problem as a whole was obviously caught in an immense jam. But now the scenes have been completely shifted; the stage is set for action. In the first place Mayor Hylan is eliminated. With his going the emotional tension has almost disappeared. Officials of the railways no longer expect to have bad names hurled at them at long range from the City Hall.—*New York Times.*

Railway Man States Facts in Simple Terms

Mr. Dahl's communications have shed light on a situation complicated by many moves and made unintelligible to many people by the magnitude of the whole question, the stupendousness of the amounts of money involved, and the seeming conflict in authority between the Board of Estimate and Apportionment and the Board of Transportation, which are purely New York city bodies, on the one hand, and the Transit Commission, a state body which is really a court of last resort on fare and other matters, on the other. Mr. Dahl said in the first of his communications that the economics of the transit relief were comparatively simple, but that the politics of it were not so easy. He expressed confidence in the sound common sense of the people of the community and expressed the belief that if hostility were eliminated and the problem approached in the spirit of mutual consideration, fairness and patience, a solution could be provided which would meet with the approval of the public. He said that as differences of opinion might exist or arise in connection with the discussion of any complicated problem, any seeming criticisms were advanced in a friendly spirit for the purpose of arriving at the truth.

As has been indicated before in this review, the proposed new independent system of subways, conceived during the Hylan hierachy, was not planned with a view to its consolidation with the existing systems. According to Mr. Dahl, expert opinion bore him out in the statement that competition and consolidation are the opposite ends of the poles in subway policy. He did not subscribe to the idea that the completion of the proposed new municipal system was necessary because it would give the city a club to hold over the heads of the Interborough Rapid Transit Company or the B.-M. T. The question he asked was this: "Why assume that a club is needed until there is evidence that someone desires to act unfairly?" He said there had never been a time when the B.-M. T. was not ready and willing to enter into open conference with any public authority for the purpose of helping to solve New York's transit problem.

One of the things Mr. Dahl did was to go into figures to show that at the end of 1933, after three years of operation of the new system by the city, the city's deficit on the existing systems, at the present annual rate, will have reached the sum of $110,760,000 for the years 1926 to 1933 inclusive. This added to the $61,994,600 losses on the new city system will make the total deficit of $172,755,800, which the taxpayers in New York will be called upon to meet. At the end of the three-year period, the law requires that the city system must be self-sustaining, and the Board of Transportation's own figures from 8 to 10 cents.

Another question Mr. Dahl asked was this: "Isn't this rather an expensive club?" As a matter of fact, he wanted to know whether it really was a club at all. He said it should be borne in mind that if the existing contracts between the city and the companies continue, the city system will then be operating at a rate of fare ranging from 8 to 10 cents, while the Interborough and B.-M. T. are operating at a 5-cent fare. Another question he asked was: "Which line will then be patronized?" This was largely the burden of the remarks contained in Mr. Dahl's first statement. In subsequent communications addressed by him to the Board of Estimate he elucidated the figures, but that is neither here nor there so far as the purpose of this account is concerned.

In short, were the city to apply sound business principles to its rapid transit program, construct needed additional facilities and co-ordinate the operation of its facilities, its entire rapid transit investment could be put on a self-sustaining basis at once. According to Mr. Dahl, such procedure would

Digitized by Google

release frozen city credits of $262,626,296 and make available additional city sums for subway construction, or private capital might be induced to provide for subway construction. He said that such a policy and program would mean rapid transit construction on a business basis in pace with the growth and business expansion of the city, not the feast and famine of the past.

WALL STREET REVELS IN RUMORS

Another question that is being asked is: "Will there be a consolidation of the transit companies, notably the Interborough and the B.-M. T., whether or not the unification scheme is adopted?" Financial circles believe there will. It is a vague unconfirmed rumor that is going the rounds about quiet acquisition on the part of the B.-M. T. interests of the stock of the Interborough Rapid Transit Company. Wall Street bases its conviction that there is something in the rumor on the fact that I.R.T. stock, which has not paid a dividend since 1919 and is apparently not likely to pay dividends in the near future, has risen from a low of about 24 to more than 52, the highest point reached since the voting trust now in control of the company was formed. This gossip is repeated for whatever it may be worth. The fact remains, however, that the voting trust certificates of the I.R.T., to which dealings are now confined, does not give the new holders an immediate voice in the management. The voting trust does, however, expire next October, and again Wall Street gossip, which is ever ready to find a way, says that the recent buyers will then have their say and that in the meantime they can make their ideas felt in any emergency that may arise.

This account does not, of course, run the gamut of all the recent moves, but the facts set down do show, as stated in the introductory paragraph, that the realization is being borne in upon the susbstantial interests in the community of the need for something constructive being done and done promptly to save the city from itself.

Shreveport Temporary Injunction Made Permanent

Three federal Judges have made permanent without any objection being offered by the Public Service Commission the injunction issued in June of this year restraining the Public Service Commission from interference with the Shreveport Railways, Shreveport, La., in the collection of a 7-cent adult fare and a 3½-cent school children fare, which was granted. In its application to the federal Judges for a permanent injunction, the company showed that under the above-mentioned rates it had not made a fair return on the value of its property, but the results of operation had changed from a constant loss to a small net profit.

Early in June of the present year the United States District Court, Eastern District of Louisiana, handed down a decision declaring null and void the order of the commission rendered on March 16, 1925, ordering the Shreveport Railway to offer seventeen tickets for $1 and four tickets for 25 cents. In the order the company was authorized to discontinue the sale of four tickets for 25 cents and seventeen for $1 and to charge 3½ cents a ride for school children during school terms and school hours. The court also restrained the commission from attempting to enforce the said order of March 16, 1925, or from interfering in any way with the plaintiff in charging and collecting the 7-cent fare. That decision in June ended the litigation which had been carried on for some three years between the Shreveport Railways and the court. The entire situation was reviewed in the ELECTRIC RAILWAY JOURNAL, issue of June 12, 1926, page 1025.

Chamber of Commerce Rejects Toledo Ordinance

The proposed new 25-year exclusive street railway and bus franchise for the Community Traction Company in Toledo, Ohio, already opposed by the Street Railway Board of Control, has been rejected by the Chamber of Commerce, representing the business interests of the city. The attitude of this organization was determined by an exhaustive study of the new ordinance by a committee over a period of nine weeks.

Many individual faults are found in the ordinance but the committee objects to it as a whole principally because of the granting of an exclusive franchise for 25 years with renewals which make it perpetual, and the provision that it can only be terminated by city purchase so as to guarantee the retirement of the outstanding securities of the Community Traction Company. The committee in its report favored a monopoly of the service provided the city had a method of withdrawing the exclusive feature by a reasonable procedure.

The independent group of business men who made the study of the transit problems did so in the light of existing conditions and recommended that capital value be maintained as at present, that the new capital of $1,051,600 for improvements be added, and that extensions be made, crosstown line developed, and new bus routes established as recommended by Prof. Riggs. These important recommendations with many minor suggestions were contained in the report made public by the Chamber of Commerce committee and unanimously approved by the trustees of the organization. The principal ones are:

1. To grant an exclusive franchise so that it may be terminated at the end of ten years to permit competition by two-thirds vote of City Council, street railway board of control, and 60 per cent of the electors.

2. To stop the payment of interest on bonds retired and canceled under sinking fund provisions.

3. To give Board of Street Railway Control power to approve contracts before instead of after execution.

4. To relieve traction company of paving obligations and in exchange ask the ownership to absorb the accumulated deficit of $850,000. Paving obligations run $100,000 or more annually.

5. To charge a maximum fare of 10 cents.

6. To give the traction company freedom to buy its power at best price, not limiting it exclusively to Toledo Edison company as source for power.

For some time now efforts have been under way between Frank M. Dotson, law director of the city, and Dewey C. Bailey, counsel for Henry L. Doherty & Company, to come to an agreement on some of the euggestions made by the Board of Street Railway Control in a letter which has not been made public but which was in answer to the request of Mayor Fred J. Mery for specific recommendations after the criticism of the board. It is understood the board of control referred the city authorities and ordinance conferees to a letter sent July 29 in which specific recommendations were made but apparently not followed in drafting of the ordinance.

The proposed ordinance which seeks to modify the Milner service-at-cost plan in conformance with proposals of Prof. Henry E. Riggs is now before the City Council. Indications are that it will have to be modified before it can be placed before the electors.

Final Fare Brief in St. Louis

An increase of fare by the United Railways, St. Louis, Mo., from 7 cents to 8 cents or two tokens for 15 cents would mean more passengers for the People's Motorbus Company. So Joseph H. Grand, city attorney for University City, St. Louis County, contended in a brief filed with the Missouri Public Service Commission on Nov. 30. In opposing the increase he held that no emergency exists which demands an advance in fares. If any increase is to come, he said, it can well await the completion of the audit of the railway's books.

In answering the argument by City Counselor Muench of St. Louis that the city should not be asked to make up the company's losses on its St. Louis county business, Mr. Grand contended that the United Railways is a single system and cannot be separated for the purpose of fare. He concluded his argument with the assertion that an increase would do the United Railways more harm than good.

St. Louis financial circles anticipate an increase in the fares. A decision to this effect by the commission would go a long way toward removing one of the few remaining obstacles to the reorganization of the system and the vacation of the receivership. It is believed that the decision when it is made will stipulate the rate of return to be allowed the new company on a fixed valuation of its property.

The belief is firm that the commission will reiterate its stand in the Laclede Gas Light Company case, decided on Nov. 20, when it said that a fair rate of return on public utilities was 7 to 8 per cent. That decision was also strictly in line with the finding of the United States Supreme Court, which held on Nov. 23 in the Indianapolis Water Company case that a utility is entitled to a return of at least 7 per cent.

Additional Names Have Been Secured

Following the striking off of some 4,000 or 5,000 names from the referendum petition, filed in Kansas City, Mo., recently by a group of Republicans, asking a referendum on the twelve-year franchise extension granted the Kansas City Public Service Company, additional names have been secured and the supplementary petition filed with the city clerk. Alleging that many of the 13,238 names on the original petition were written by the same persons, officials struck off a large percentage of the names, making it necessary for the sponsors of the petition to secure approximately 4,000 additional signatures. Ten days were allowed the originators of the referendum petition in which to secure names to replace those cut out by the city clerk's office. The new list, filed Dec. 3, contained 7,386 names, more than sufficient to make up the deficit. The city clerk is allowed five days in which to make a canvass of the petition for errors.

Denver Changes Methods of Letting Utility Franchises

The City Council of Denver, Col., at its Nov. 29 meeting decided upon a change in the method prescribed by it for letting utility franchises. The regulation had previously required the petitioner to submit his proposition at least six months before the date the voters were expected to pass on it and to publish the terms and rates twice in newspapers of regular and large circulation. That portion of the law was killed. The Council stated it was superfluous and inactive and that the city charter and state laws were adequate to take care of such contingencies.

Changes in Honolulu to Prevent Fare Increase

Curtailment of service and extensive rerouting are included in the plans of the Honolulu Rapid Transit Company, Honolulu, Hawaii, designed to avoid for the time being an increase in the rate of fare and to approach more closely the fair return on the existing investment as computed by the Public Utilities Commission. An announcement to this effect was made recently by President Alfred L. Castle.

A petition requesting permission to reroute the company's cars over practically every line in the city and to eliminate certain phases of the service now furnished has been filed with the Utilities Commission. Statistics made public indicate that the company has suffered not only material decreases in passenger traffic, due largely, it is said, to the rapid increase in the number of automobile owners, but also decreases in its new revenues in spite of the recent increase in the fare. In addition to the rerouting and discontinuance, the company plans to purchase eight one-man, two-man cars at the cost of about $136,000 and a bus to operate in Kaimuki.

In his explanatory statement Mr. Castle said that the directors had studied the proposition from every angle and were making every effort to effect savings which would not mean an increase in fare. He said that in the internal organization the personnel had been materially cut down to a point beyond which it was not advisable to go.

In its decision of September, 1924, the commission found that the company had properties devoted to public service to a fair value of $3,250,000, on which it was entitled to a return of $260,000. New rates went into effect on Oct. 1, 1924. In 1925, with a full year of these rates, the company's net revenue was $198,654, which was about $60,000 less than the amount to which it was entitled by the decision of the commission. Mr. Castle said that this year, in spite of all the economies practised, the net earnings would probably run about $150,000. This is $110,000 less than the fair return allowed by the commission. Another basis of comparison was the first ten months of 1925 compared with 1926. In 1925 the net revenue for the first ten months was $162,584, compared with $133,054 for 1926. This was due, he said, to the falling off in the number of passengers carried. The figures of the first ten months of 1925 show 13,452,782 full-fare passengers and 1,147,502 half-fare passengers; for the first ten months of 1926 these figures were 12,710,246, and 1,123,652, respectively.

He claimed that the extensive rerouting could be done at very little expense and that the saving by the rerouting and by the installation of one-man operation on certain lines would total $50,000 a year.

In filing its petition the company has requested a public hearing on all proposals involved.

News Notes

Wages Discussed at Indianapolis.—Members of a committee recently selected by employees of the Indianapolis Street Railway, Indianapolis, Ind., to discuss a request for an increase in wages and a change in working conditions with company officials, met recently with James P. Tretton, superintendent, in a preliminary conference. No wage demand was presented by the committee and it was said that the wage changes would be advanced later at a meeting with other members of the company's official body.

Bulletins Link Old and New.—In order that the present generation of trainmen in New Brighton, Pa., may keep in touch with their Victorian ancestors the Beaver Valley Traction Company issues bulletins from time to time on the 25-year men who are now pensioned employees. Addressed "Dear Fellow Employee" and signed by General Manager Smith, these pamphlets disclose the whereabouts of an old employee, his date of entrance into service and the conduct of his service.

Collectors Expedite Traffic.—Eleven collectors have just been placed on duty at down-town street corners in Atlanta by the Georgia Railway & Power Company to aid in speeding up traffic during the rush hours. These collectors will be on duty every afternoon except Sunday from 4 o'clock until 6:30 and will accept fares, make change and collect tickets.

Tickets to Increase Earnings.—The Danville Traction & Power Company, Danville, Va., has announced that on Jan. 1 it will put on sale tickets for $1 permitting an indefinite number of rides. These tickets will be transferable. The new rate will be tried for an experimental period of eight weeks to determine the effect of the change upon earnings.

Must Arbitrate in Danbury.—A deadlock exists between the striking employees of the Danbury Power & Transportation Company, Danbury, Conn., and the railway management, with the company unwilling to recognize the Amalgamated Association under a similar working agreement to that in force with the Danbury & Bethel Street Railway. That was the old organization out of which the new company grew. The City Council has formally notified the company and the Public Utilities Commission that failure to arbitrate the dispute will mean the canceling of all existing franchises. The intention of the company to motorize the system brought about the present tense relationship.

Veterans Receive Buttons. — The Wheeling Traction Company, Wheeling, W. Va., now has 106 employees who have been in the service of the company for twenty years or more. Nine veteran workmen of the company were recently presented with service buttons, which automatically makes them members of the Veterans' Association. The service buttons were presented by A. C. Spurr, general manager of the Wheeling Traction Company. The Veterans' Association was founded four years ago. The oldest member is M. C. Marsh, who has been in the employ of the company for more than 38 years.

Hearing Held Over.—Rehearing before the Interstate Commerce Commission on the application of the Salt Lake & Utah Railroad, Salt Lake City, Utah, to participate equally with other roads in the hauling of transcontinental freight has been postponed from Dec. 3 to Dec. 11. The rehearing was deferred at the request of the railroad, as well as the opposing trunk lines.

Must Serve Sentence.—A petition to suspend the balance of his sentence of 120 days which he has been serving since Sept. 9 in the Marion County jail was recently denied Harry Boggs by Federal Judge Robert C. Baltzell. Boggs, former head of the union on the Indianapolis Street Railway, Indianapolis, Ind., was sentenced for contempt of court when he was charged with violation of terms of an injunction prohibiting interference with the operation of street cars during the strike last summer. Judge Baltzell maintained no substantial reasons had been presented to warrant a suspension of the sentence. Reference to the Boggs incident was made in the ELECTRIC RAILWAY JOURNAL, issue of Oct. 23, page 778.

Recent Bus Developments

St. Paul Admires Its Twin City

Inspired by the convenience and success of the new Hennepin Avenue 10-cent bus line in Minneapolis, Minn., from the heart of the city to 36th Street, operated by an auxiliary of the Minneapolis Street Railway, Commissioner C. J. McGlogan of the St. Paul City Council will present a resolution which will authorize taking up with the Minnesota Railroad and Warehouse Commission a request for similar service in that city. He is also taken with the Minneapolis system of crosstown bus lines on Lowry Avenue and on 38th Street, which connect with trolley lines at the same rate of fare and with transfer privileges. T. Julian McGill, vice-president of the Twin City Rapid Transit Company, said that the 10-cent bus line in Minneapolis was demanded and made possible by business men. The line is not in competition with the electric railway lines and pursues a devious course, crossing trolley lines at four points. Mr. McGill said that if St Paul would provide a profitable route that did not compete with street cars the company would be glad to operate a 10-cent bus line over it.

Hearing on Bus Specifications in New Jersey

The Board of Public Utility Commissioners of New Jersey has under consideration the amendment of the specifications applying to buses adopted on Dec. 29, 1924, and is also planning to adopt specifications relating specifically to buses of what is commonly known as the de luxe type.

With the end in view of obtaining the views of auto bus operators, manufacturers and others interested a conference between the board's transportation department and all parties interested will be held at the offices of the board in Newark on Dec. 21, at 11 a.m.

In anticipation of the hearing the board has transmitted to bus operators and others through Philander Betts, its chief engineer, a copy of the specifications intended to apply to the street car type of vehicle.

Cleveland Councilman Provoked at Bus Losses

Councilman Herman H. Finkle, Republican floor leader of Cleveland, Ohio, has raised the question of the losses alleged to have been sustained by the Cleveland Railway in the operation of its buses. He has suggested the abandonment of the bus lines. Mr. Finkle said that bus operation in Cleveland had, since its inception on Aug. 1, 1925, piled up a loss of $319,593. These are Mr. Finkle's figures. This total, it is said, does not include fixed charges of more than $200,000.

The position of the Cleveland Railway is that the bus lines it sought to operate are paying or virtually paying their own way. Such losses as are being incurred are piling up on the so-called feeder routes started at the behest of the Council. The position of Col. Joseph H. Alexander, president of the Cleveland Railway, is that the company, if the criterion sought now to be applied to the buses is to prevail, should abandon the operation of certain rail lines which have failed to pay profits for years.

Street Railway Commissioner Ballou is in accord with Colonel Alexander in this matter. He said that the Council ordered operation of the bus routes which are said to be losing money. It seems that under the provisions of the service-at-cost plan at Cleveland the Council holds the power to alter all schedules of the railway and that if the members of the Council see fit they have the power to direct the abandonment of operation of buses on any lines on which they may deem the suspension of service to be desirable.

Indeterminate Permits Suggested for Buses

The Public Utilities Commission of Massachusetts is seeking the passage of legislation to place buses in the same category as street railways with respect to licenses. At present licenses are issued to bus companies for only a short duration. The commission wants the period of the license indeterminate. The change is expected to improve service and stabilize investment in bus securities. The commission still favors licensing authority by cities and towns, but would appoint a state department to attend to the formulation of licenses.

Buses on Pennsylvania Line Increase Business

Since the Scranton Railway, Scranton, Pa., substituted a de luxe bus service for trolleys over the stretch from Carbondale to Forest City, Pa., there has been an increase of 130 per cent in the number of passengers carried. For the present three buses are operating. The Carbondale-Forest City line runs through Vandling, a distance of 7.2 miles. The right-of-way is through a very narrow valley which is practically owned by the Delaware & Hudson Coal Company, with which an agreement regarding operating rights was arranged in 1902.

The track has always been a difficult one to maintain for spring freshets frequently damage the roadbed. In recent months the difficulties became even more serious. It would cost $76,000 to restore the track to first-class condition. This, coupled with the fact that no permanent right-of-way could be secured, made the continued operation of the line practically impossible and hastened an application to the Public Service Commission for temporary abandonment and substitution of buses.

Would Increase Bus Service

The Lincoln Traction Company, Lincoln, Neb., has applied to the State Railway Commission for authority to abandon service on four car lines and substitute buses, in addition to the ones where buses give either supplemental or substituted service. If the permission is granted the company will have a total of fourteen buses in service. One of the lines upon which service will be abandoned is that operating between the city and farm campuses of the University of Nebraska. Buses will give more direct connection over paved streets and the service will be extended to include the suburb of University Place, 1 mile beyond. Another bus will supplant railway service to the more distant suburb of Bethany, reached from the center of the city by a circuitous route.

Bus Terminal in Philadelphia Under Consideration

The Public Service Commission announced recently that it would meet in the State Capitol in Harrisburg on Dec. 14 to consider the possibility of establishing an underground bus terminal to relieve traffic congestion in Philadelphia, Pa. The commission will receive the recommendations of its engineers and experts who have just completed a survey of bus operating conditions in New York, Boston and other metropolitan areas. The Philadelphia Rapid Transit Company, three railroads entering Philadelphia and independent operators of bus lines have been invited to attend and submit suggestions.

Wheeling Company Plans Bus Extension

If applications now before the Ohio Public Utilities Commission are granted the Wheeling Traction Company will more than double bus line mileage. The company now operates 65 miles of bus lines and has applied to increase this to 135 miles. This service is supplemental to its electric railway lines.

The company seeks a bus franchise between Wheeling and Steubenville by way of Warwood, Wellsburg and Follansbee, and a franchise between Wheeling and Moundsville by way of Benwood, McMechen and Glendale. The company proposes to operate special de luxe buses equipped with individual seats. In case the franchises are granted the company plans to extend service over Moundsville. It would give Moundsville a complete city service by creation of a route to the eastern part of the municipality, which is now without transportation facilities. The company has also asked for a franchise between Bellaire and Wheeling.

Bus Competition Threatened in Louisville

A new bus line is proposed for Louisville, Ky., to operate in competition with the Louisville Railway at a cash fare equal to that of the railway and a ticket fare three-quarters of a cent lower than the railway fare. The plans for the competitive service became known on Dec. 6 when an article was

Digitized by Google

published in one of the local afternoon papers regarding the formation of the Peoples Transit Company. There is talk of starting the new service before the end of the year, possibly by Dec. 16.

James P. Barnes, president of the Louisville Railway and its subsidiary, the Kentucky Carriers, Inc., stated that his company knew nothing definite about the proposed line until the plan was announced in the local daily papers. He foresees higher street car fares with such a situation. The railway must have an income sufficient to cover the cost of operating its cars. If its income is curtailed by competition, higher fares are inevitable.

As another commentator saw it, the operators of the proposed bus line would have to be smarter than are the railway men if they can make a bus line pay, as the railway has had plenty of experience in the field and has been unable to make expenses.

Mayor A. A. Will stated that the proposal had been known by city officials for some time, but that there were no existing laws which could keep the competition off the city streets, the only requirement being that the operators pay their taxes and licenses, and protect passengers and the general public by adequate insurance.

Third Bus Auxiliary Service Started.—A new auxiliary bus service to the rapidly growing Center Hill suburb of Atlanta to supplement the service on the River Street car line has just been started by the Georgia Railway & Power Company. The bus operates on weekdays and a regular schedule, except during the noon hours, is maintained, connecting with the street car service on the River Line. The fare on this bus is 10 cents and entitles the passenger to continue his journey on the street car and transfer to any other line in the city. A transfer and 3 cents entitles the outgoing passenger to a trip on the bus line. The fare for passengers desiring to use only the bus service is 3 cents. This is the third auxiliary bus line put in service by the Georgia Railway & Power Company, the two others operating to Sylvan Hills and to Atlanta Avenue in the Grant Park section of the city.

Rerouting Serves New District.—The St. Louis Bus Company, auxiliary of the United Railways, St. Louis, Mo., has rerouted its Morganford-Loughborough Avenue line to serve a larger territory in Southwest St. Louis, and on Nov. 30 the Board of Public Service will hold a public hearing on the application of the company for a permanent permit to use the additional streets. Through this new connection the bus line gives the residents of one of the newer residential sections of the city a city-wide co-ordinated transportation service.

New Service Started.—The Canton, Akron & Cleveland Coach Company, a subsidiary of the Northern Ohio Power & Light Company, has started the operation of a new coach line between Canton and Cleveland, Ohio. Buses leave Canton every hour and consume about the same running time as interurbans.

Financial and Corporate

$18,000 Surplus in Phoenix

Surplus of approximately $18,000 is the result of the operation of the Phoenix Street Railway, Phoenix, Ariz., under municipal operations for one year ended Nov. 1. This fact was disclosed in a report submitted to the City Commission recently by City Manager Henry Rieger. In his report he recommends the rehabilitation of the line.

The report shows total receipts during the year at $160,896 and total disbursements, including expenses and other costs, $143,056. If the lines had been rehabilitated and up-to-date rolling stock secured it would have been possible to cut maintenance charges to $26,666. Added to the cash on hand, it would have made $44,506 cash on hand, and with a 7-cent fare the surplus for the year would have reached $75,000 under proper operating conditions, according to General Manager Rieger. He recommends complete rehabilitation "as a decidedly good paying investment for the city and for the citizens of the city at large." He stresses the need for new, up-to-date, light one-man cars, which would net a saving of at least 25 per cent on power bills and possibly give a six-minute headway service.

Another factor in lowering the surplus for the past year has been the change in status of the employees. When all employees were placed on an eight-hour basis, it was done without any loss in salary to the employees. Where men were working eight, ten and twelve hours a day, the eight-hour rate was computed so as to give them an amount of salary equal to what they had been drawing under the longer day plan. The placing of the men on the eight-hour basis necessitated the employing of additional help, which raised the payroll about 20 per cent over previous years.

The city of Phoenix acquired the properties of the street railway by purchase on June 4, 1925, for $20,000 and assumed direct operation and control on Nov. 1, 1925. Various circumstances leading up to the city's taking over the lines were reviewed in the ELECTRIC RAILWAY JOURNAL from time to time.

Plans Being Made to Refinance Michigan Interurban

The Grand Rapids Trust Company, receiver for the Grand Rapids, Grand Haven & Muskegon Railway, Grand Rapids, Mich., has notified the Michigan Public Utilties Commission that plans are well under way by the trust company and a committee representing the bondholders to refinance the road and lift the receivership.

Sidney L. Vaughn, general manager of the road, and Peter Kline of the trust company appeared before the commission on Nov. 30 and sought a permit to operate bus service between Grand Rapids and Grand Haven and between Grand Haven and Muskegon.

The application was opposed by the Safety Motor Coach Company, now operating between Grand Rapids and Muskegon and Grand Haven and Muskegon. The coach company asked for a permit to operate between Grand Rapids and Grand Haven in opposition to the request of the railway.

Mr. Vaughn told the commission the railway planned to supplement the present interurban service with buses, giving hourly service to the three cities from 5 a.m. one morning until 1 a.m. the following morning. He said that back in 1920 the passenger revenue of the line was $486,780, compared with $186,540 last year and $122,965 for the first nine months of the present year. Both Mr. Vaughn and Mr. Kline denied that the Insull interests were back of the effort of the railway to get the bus permit.

The hearing was adjourned until Dec. 11.

Springfield Council Approves Agreement

The City Council of Springfield, Mass., on Dec. 6 approved the agreement between the city and the New York, New Haven & Hartford Railroad by which the railroad acquires the lines of the Springfield Street Railway. From $1,000,000 to $1,500,000 will be expended in improving equipment and service. This is another step in the plan for the restoration of certain electric railway lines in Massachusetts to New Haven ownership and for their physical rehabilitation.

Traffic Wage and Fare Figures

There was a slight decrease in the number of passengers carried during the month of October, 1926, compared with October, 1925. This can be traced partly to industrial conditions in certain sections of the country and partly to the fine weather which prevailed throughout the month, which tends to increase the use of private automobiles for transportation purposes.

The number of revenue passengers, including bus passengers, reported to the American Electric Railway Association by 207 companies for October, 1926, compared with October, 1925, is as follows:

October, 1926	807,623,596
October, 1925	809,134,380
Decrease, per cent	0.19

Average cash fares in cities of 25,000 population and over:

	Cents
Nov. 1, 1926	7.7423
Oct. 1, 1926	7.7056
Nov. 1, 1925	7.5996

Average maximum hourly rate paid motormen and conductors in two-man service by companies operating 100 miles or more of single track:

	Average Hourly Rate	Index Number 1913 = 100 Per Cent
Nov. 1, 1926	56.88	208.73
Oct. 1, 1926	56.87	208.70
Nov. 1, 1925	56.29	206.57

$10,000,000 Virginia Bond Issue Approved

Stockholders of the Virginia Electric & Power Company, Richmond, Va., have authorized a bond issue of $10,000,000 to cover the expenditures contemplated in the 1927 program. Of the bond issue, $6,000,000 in first and refunding mortgage gold 5s were offered publicly on Dec. 10 and the accruing fund will be made immediately available for next year's elaborate improvement program. It has also been voted to place the company's authorized capital stock at $15,000,000 and to reclassify the $4,513,000 of unissued 7 per cent cumulative preferred stock to be issued as 6 per cent cumulative preferred stock.

As a result of this and other steps now being taken Richmond's unified bus and railway system is expected to be in full operation before the end of next year, dependent largely upon the opening of new streets to the intended bus lines. According to William E. Wood, vice-president of the company, this improved system will cost the company about $1,500,000. Several routes probably will be started in January on the receipt of buses now under construction. Tracks are also being extended and other similar work will be started as soon as practicable.

Approximately $15,000,000 of the $20,000,000 in the full 30-month program has been directed to new construction work and improvements on existing properties through Tidewater Virginia and eastern North Carolina.

Will Cease Cashing Warrants in Seattle

The Clearing House Association at Seattle, Wash., has unanimously refused to cash any more warrants for the Seattle Municipal Street Railway, declaring they are an illegal investment. The railway was slated to go on a warrant basis on Dec. 10 to pay labor and material costs for the last half of November. Mayor Bertha K. Landes advocates payment of warrants by city on date due, which will postpone warrant basis for two weeks.

Indiana Road to Start Afresh

The property of the Fort Wayne, VanWert & Lima Traction Company, Fort Wayne, Ind., has been sold at receiver's sale at Fort Wayne, Ind., to the bondholders for $150,000. The bondholders were represented at the sale by Edward Hopkinson.

The company will be reorganized in accordance with terms outlined at some length in the ELECTRIC RAILWAY JOURNAL for June 12, page 1030, under which it is proposed to create a voting trust to continue for five years.

Spokane Interurban Lines Sold

The sale of the interurban lines of the Inland System, operating 180 miles of active trackage between Spokane, Wash., and Cœur d'Alene, Idaho, and between Spokane and Moscow, Idaho, to the Great Northern Railways was announced in Spokane on Dec. 3. Report of the sale was confirmed by Major A. M. Anderson of the Great Northern staff. The sale will be subject to the consent of the Interstate Commerce Commission. The property consists of the Inland Empire Railroad, owning the Moscow line and the Spokane & Eastern Railway & Power Company, which leases the Cœur d'Alene line from the former company. M. J. Costello, western traffic manager of the Great Northern, is arranging with the city to make physical connections of the properties in order that Inland operations may center at the large Great Northern depot.

If the permission of the commission is secured the deal will be made retroactive to Dec. 1, with actual operating management beginning about Dec. 10.

Street railway properties of the related "Inland" and traction companies were merged three years ago into the new Spokane United Railways, and the power station at Nine Mile was sold last year to the Washington Water Power Company. The Great Northern purchase will complete the transfer of all the former properties of the system.

Engineers Public Service Reports on Financing

In a report sent recently to stockholders the Engineers Public Service Company outlines its progress and gives data on the results of the financing effected by the sale of allotment certificates.

To provide a portion of the funds necessary to acquire more than two-thirds of the common stock of the Virginia Electric & Power Company, Richmond, Va., and finance the acquisition of other properties operating in the Virginia district common stock and 50 per cent paid allotment certificates were sold in July, 1925. The company issued 109,957 shares of 7 per cent preferred stock and 500,000 shares of common stock and had a floating debt of $3,500,000 on July 31, 1925.

Since that time the company has acquired nearly all the minority common stock of the Virginia Electric & Power, the controlling interest in the Eastern Texas Power & Light Company, the El Paso Electric Company, the Savannah Electric & Power Company, the Baton Rouge Electric Company and the Key West Electric Company. The company now has no floating debt and has about $5,000,000 additional assets in securities and cash.

Outstanding stock at the close of business Nov. 20, 1926, totaled 204,297 3-12 shares of 7 per cent preferred and 778,938 shares of common stock.

Changes Effected in Alton Properties

The St. Louis & Alton Railroad, which has taken over the old Alton, Granite & St. Louis traction line, extending from Alton, Ill., to St. Louis, Mo., with a branch line from Mitchell to Edwardsville, Ill., has been granted a charter to do business by Secretary of State Emerson of Illinois.

The Alton Railway, Alton, Ill., which has taken over the Alton city lines, has increased its capital stock from $500,000 to $750,000.

Detroit Street Railways Must Pay Income Tax

Notice has been received at the office of the Detroit (Mich.) Corporation Counsel that the Department of Street Railways must pay federal income taxes as a corporation and that employees of the department must pay income taxes as individuals. The ruling was forwarded to the municipal office by the local collector of internal revenue.

A test case was started in 1923 when the government contended that Department of Street Railways employees must pay federal income taxes. The judge in the local federal court held that the municipal railway was exercising a governmental function and that the income tax law did not apply to its employees.

The case was appealed to the U. S. Supreme Court by the Department of Internal Revenue, but before the Supreme Court could act the provisions of the income tax law as it applied to such employees were rescinded by an act of Congress. The case was then considered closed, but the act of Congress applied only to taxes to be paid prior to 1925. The Commissioner of Internal Revenue has recently ruled that municipally owned public utilities were proprietary functions, and not governmental, and as such were taxable the same as any private business, and that employees of such utilities were subject to income tax. This ruling applies for 1925 and 1926.

The local collector has been instructed by the Internal Revenue Department to collect the taxes from city employees and the city. The collector cited that if the city and its employees show a willingness to co-operate an early collection of the taxes for 1925 may be anticipated. In case of failure to comply with the regulations on the part of the city or its employees procedure will be as in the case of other income tax payers. A reasonable time will be allowed in which to pay taxes.

Rate of Return a Stumbling Block in St. Louis

The reorganization committee of the United Railways, St. Louis, Mo., which has formed the St. Louis Public Service Company to take over the property when the receivership ends, seeks a 7 per cent return on the valuation fixed by the Public Service Commission, while Mayor Miller has expressed the belief that 6 per cent is enough under the service-at-cost franchise arrangement intended to be put into effect.

This point and the question of how the company should liquidate the old mill tax judgment and the current mill tax and existing franchise taxes are apparently the only things really in the way of an immediate termination of the receivership.

In a talk before the St. Louis Chamber of Commerce on Nov. 24 Mayor Miller declared that he was anxious to have the railway problem settled by completion of the reorganization so that the city could obtain the kind of service to which it is entitled. He refrained from further mention of the points at issue.

Digitized by Google

The valuation of slightly more than $51,000,000 as of 1919 set by the state commission brought up to date would entitle the company to earn a net return on approximately $56,000,000.

Foreclosed Ohio Interurban to Continue

Property of the Cincinnati, Lawrenceburg & Aurora Electric Street Railroad Company, offered for sale at foreclosure on Dec. 1, was purchased by the Union Trust Company, as trustee for the bondholders, for $205,000, which was $5,000 in excess of the upset price fixed by the Common Pleas Courts of Hamilton County, Ohio, and Dearborn County, Indiana. C. H. Deppe, president of the trust company and one of the two receivers for the interurban company, said that operation would continue under the supervision of the bondholders. Mr. Deppe also said that a new corporation would be formed before the first of the year. The interurban operates between Anderson's Ferry and Aurora, Ind., a distance of 57 miles.

Would Abandon Portion of Line

The Lewiston & Frontier Railroad, leased by the Niagara Gorge Railroad, filed a petition recently with the Public Service Commission asking for the approval of declaration of abandonment of portions of its electric railway in the village of Youngstown, Niagara County, and adjoining towns in New York.

The petition states that for more than two years passenger service has not been furnished to and into the village of Youngstown, such service having been discontinued with the consent and approval of the village officials on the commencement of operations by the Gray Bus Line.

The right-of-way of the electric railway has been used occasionally for operating freight cars for the delivery of coal to the U. S. Government Reservation. Such operations, however, the company states, have been at a loss. In addition, the pavement on Main Street is in need of reconstruction and when done, would impose a large capital expenditure on the railway thus increasing the value of its property devoted to public service without prospect of any return being realized from the operation of the road.

Key Route to Issue $1,500,000 in Bonds.—The Key System Transit Company, Oakland, Cal., plans the issuance and sale of $1,500,000 of first mortgage 6 per cent bonds to the National City Company partially to finance a $9,000,000 reconstruction and improvement program, provided approval is obtained from the State Railroad Commission.

Dividend Deferred.—The directors of the Interborough Rapid Transit Company, New York, N. Y., deferred action on the quarterly modified guaranteed dividend of $1.25 of the Manhattan Elevated owing to the fact that it was not earned in the September quarter. This disbursement is determined by the earnings for the third quarter of each year under the terms of the Interborough-Manhattan readjustment plan of 1922.

Book Reviews

Arc Welding—The New Age in Iron and Steel

By the Lincoln Electric Company, Cleveland, Ohio. 160 pages. $1.50.

Devoted largely to the use of arc welding in general production manufacturing, but giving knowledge of arc welding principles and equipment now available, the new book on arc welding by the Lincoln Electric Company is most comprehensive. It contains more than 200 illustrations of products which are manufactured by arc welding. In addition there are numerous diagrams and charts showing welding speeds and costs.

The use of arc welding in place of riveting is discussed thoroughly, and a chapter is devoted to the field for arc welding by substitution of arc welded steel for cast iron. The discussion shows how to go about redesigning cast iron for manufacture in steel and illustrations are given to show where this is being done commercially.

The opening chapter discusses the superiority of steel over cast iron from both the standpoint of strength and economy. One chapter is devoted to automatic arc welding and there are numerous illustrations showing products welded automatically.

The book is 6 in. x 9 in. It is bound in imitation leather.

Trade Agreements 1925

United States Department of Labor, bureau of labor statistics, Washington, D. C. 152 pages. 25 cents a copy.

This pamphlet devotes eleven pages to extracts from certain agreements between electric railways and the Amalgamated Association. The properties mentioned are the Community Traction Company, Toledo, Ohio; Memphis Street Railway, Memphis, Tenn.; Illinois Power & Light Corporation applicable to its railway department in Bloomington and Normal, Ill.; Trenton & Mercer County Traction Corporation, Trenton, N. J.; Chicago, Aurora & Elgin Railroad, Wheaton, Ill., and the Salem and Amesbury divisions of the Massachusetts Northeastern Street Railway.

Guiding Principles of Public Service Regulation

Henry C. Spurr. Public Utilities Reports, Inc., Rochester, N. Y., and Washington, D. C. 919 pages.

Under the heading "Returns to which Utilities are Entitled" Mr. Spurr begins the third volume of his work on the principles involved in the laws affecting utilities. He then takes up the subject of fair or reasonable return, attraction of capital, efficiency in management and service, miscellaneous factors affecting returns. From the broad subject of a consideration of factors in rate making he shows these factors in specific utilities—water, gas, electric, street railway, interurban railway and telephones. A discussion of street railway rates consumes 47 pages, dealing principally with electric railway apportionment in general and then taking up the apportionments between different branches, different lines, interurban and suburban business and freight and passenger business. There is included a discussion of the 5-cent fare, the 6-cent fare, the 7, 8 and 10-cent fare. In connection with fares reference is made to the statistics furnished by the American Electric Railway Association on average cash fares in American cities. The book also explains the status of interurban railway rates. The text is based on court and commission decisions and is elaborated by a table of the various cases cited. Some 52 pages make up a carefully prepared index.

Business Annals

By Willard Long Thorp. National Bureau of Economic Research, Inc. New York. 380 pages. $4.

Particularly at this time, when so many persons hold to the view that the present is a period of inordinate prosperity in the United States, is this sobering volume of interest not only to manufacturers but to railway men. Economic changes that affect the one affect the other despite the fact that the extent of the consequences of any change in the economic status may vary greatly as between two lines of business activity.

Problems are not solved by shutting the eyes to them. Yet that is done far too often in the case of economic questions despite the professed desire to be fortified with the facts for dealing with each occasion as it arises. And here are the facts. They should not be ignored just because they are likely to be sobering in their influence by restoring a sense of perspective. In this work of 380 pages the author has presented in descriptive form the business cycle history of seventeen countries in all quarters of the world for periods ranging from 36 to 136 years. It is probably the most comprehensive survey of the world's experience with business booms and depressions which has ever been made. In the report are answers to such questions as: When have periods of depression begun? How long have they lasted? What brought the depressions? When have revivals of activity occurred? How have these revivals progressed? How are the different branches of business related? How are different countries related?

Simultaneously with their collection, these facts have been anlyzed by Dr. Wesley C. Mitchell. His deductions are contained in the introductory section, entitled "Business Cycles as Revealed by Business Annals."

The information is believed by the publishers to be the latest and most authoritative on the occurrence of business cycles and on the duration of periods of prosperity and depression. It is the first collection of its kind assembled for Dr. Mitchell's use since publication of his first studies in 1913.

It is expected that "Business Annals"

Digitized by Google

will be followed at short intervals by other reports under the direction of Dr. Mitchell. These reports will provide a thoroughgoing analysis of the facts regarding fluctuations in business.

The bureau is its own publisher. It aims to distribute its reports at prices just sufficient to cover publication expenses, all the research costs being defrayed from contributions to the bureau's general funds.

Mundy's Earning Power of Railroads, 1926

Compiled and edited by Floyd W. Mundy. J. H. Oliphant & Company, New York, N. Y. 535 pages.

In this 21st issue of this annual publication data and statistics are given on 127 railroads relating to their earning power and to their securities arranged in convenient form for ready reference. Practically all the important railroads in the United States are included. Some introductory chapters explain to the investor general principles which must be applied in determining the value of the stocks or bonds of any railroad. The many tables with data on mileage, expenses and other items afford ready comparison and notes expand the information.

The Indeterminate Permit, In Relation to Home Rule and Municipal Ownership

By Delos F. Wilcox, Ph.D. Published by the Public Ownership League of America, Chicago, Ill., as "Bulletin 35." Paper, 99 pages. $2.

The thesis on which this book is written is that when the indeterminate permit for utilities was invented in 1907, and for some years later, it looked like a very desirable plan, but that experience shows it is not so desirable as it at first appeared to be. The only safe policy is municipal ownership and operation. The trouble with the indeterminate permit, in the opinion of Dr. Wilcox, is that it depends ultimately for success on satisfactory public control and the right of the public to terminate the permit for cause. The author believes that both state regulation and the right to terminate a terminable permit have broken down, and this form of franchise now gives utilities "an indefinite lease of life without requiring them ever to come back to the municipality for an accounting of their stewardship and without giving the municipality any effective power to cut their lease of life short. Under the indeterminate permit, the companies are in to stay, and their good or ill behavior has little or nothing to do with it." This theory is developed in the 99 pages of the book.

Railway Statistics of the United States of America

Prepared by Slason Thompson, Bureau of Railway News and Statistics, Chicago, Ill. Tucker-Kenworthy Company, Chicago. 148 pages.

Here is a comparison of steam railway statistics for the year ended Dec. 31, 1925, with the official reports for 1924, as well as recent statistics of foreign railways. This is the 23d year of the publication of this booklet. The usefulness of this pamphlet is enhanced by maps, tables and illustrations.

Personal Items

F. S. Elliott to Superintend Inland Empire for New Owners

F. S. Elliott, general superintendent of the western division of the Great Northern Railway, has been made general superintendent in charge of operation of the Spokane & Eastern Railway & Power Company and the Inland Empire Railroad, electric interurban properties in the Spokane district purchased by the Great Northern. Mr. Elliott and M. J. Costello, traffic manager of the Great Northern, western division, are engaged in the negotiations incidental to merging the former Inland system into the Great Northern organization. So far Mr. Elliott is the only Great Northern official designated for appointment to the Inland System by the new owners. The personnel of the Inland will not be merged into the Great Northern system until the Interstate Commerce Commission approves the transfer of the interurban properties to the transcontinental line, an action hoped for late this month.

Following the war Mr. Costello was operating head of the Inland, but the property was returned to the bondholders in 1919. In fact, the Great Northern owned the Inland system jointly with the Northern Pacific from 1911 to 1918, during which time it was under the Spokane, Portland & Seattle, in which both the steam railroads were interested. The Inland is now purchased by the Great Northern alone. W. P. Johnston has been general manager. He succeeded F. E. Connors and Waldo G. Paine, both deceased. With permission of the Interstate Commerce Commission the sale will be effective as of Dec. 1.

C. M. Griffith Made Vice-President of Wharton Company

Charles M. Griffith, long associated with William Wharton, Jr., & Company, Easton, Pa., has been elected vice-president of the company. Mr. Griffith has back of him a wealth of experience in railway work, but counts as his choicest experience during his long association with the company his acquisition of so many good friends and acquaintances. He has looked with more or less composure on the rise of the bus recently, for years ago, when he was just cutting his experience teeth in business, he was secretary of the Omnibus Company, General, Philadelphia. This was in the day of the three-horse, double-deck passenger buses on Broad Street. With him recollections of these days, remote now to many others who lived through them, remain alive as reminiscences of history in the process of repeating itself.

Mr. Griffith has served in various capacities with William Wharton, Jr., & Company, Inc., and its associated interests since the days of flat tram rails and cast iron special work. When the Wharton company rolled its own girder rails and T rails at the mills of the North Branch Steel Company at Danville, Pa., Mr. Griffith acted as secretary and buyer of that company. More recently he has been sales manager of the Wharton company as well as a member of the board of directors of that company, the Philadelphia Roll & Machine Company and the Tioga Steel & Iron Company.

Melvin A. Traylor Elected to General Electric Board

Melvin A. Traylor, president of the First National Bank, Chicago, was elected a director of the General Electric Company at a meeting of the board in New York on Nov. 24. He is well known to electric railway executives, particularly in the Central West, and was one of the speakers at the convention of the American Electric Railway Association in 1923.

In addition to his executive position with the First National Bank Mr. Traylor is a director of the Stock Yards National Bank, Chicago; of Fairbanks, Morse & Company, Chicago, and of Austin Nichols & Company, New York. He is also a member of the advisory committee of the Central Manufacturers District Bank of Chicago and chairman of the finance committee of the National Wool Warehouse & Storage Company.

Mr. Traylor was born in Breeding, Ky., on Oct. 21, 1878. He studied law at night and was admitted to the Texas bar in 1901. In 1922 the honorary degree of master of arts was conferred on him by the University of Illinois. He is a trustee of Northwestern University and the Newberry library, and during the war served as director of sales of United States treasury certificates of indebtedness for the seventh federal reserve district.

He is a member of the American Bankers' Association, the Illinois Bankers' Association, the American Economic Association, Southern Society of Chicago and Art Institute of Chicago.

Changes in Staff of California Commission

Charles Grunsky has been appointed gas and electric engineer of the Railroad Commission of California, to succeed A. V. Guillou, promoted to be assistant chief engineer. J. G. Hunter, transportation engineer, has been appointed to succeed A. C. Mott, who has been appointed chief engineer of the commission to succeed Lester S. Ready. The new officials will assume their positions immediately.

Mr. Grunsky has been with the commission since 1914. He was employed on valuation work up to 1922, and, for the major portion of the time since 1922, as an assistant engineer in the gas and electric division. He is a graduate of the University of Califor-

Digitized by Google

nia and engaged in construction work for a year before entering the employ of the commission. During the World War Mr. Grunsky went overseas and, after the armistice, he returned as a captain in the engineer corps.

J. G. Hunter entered the employ of the commission in April, 1920, worked as an assistant engineer part of the time in the hydraulic division and, since 1923, in the transportation division. Since 1924 he has represented the transportation division in the Los Angeles office of the commission. Mr. Hunter is a graduate of the University of Utah, was employed for a number of years in the office of the city engineer at Portland, Ore., and, later, in the U. S. Geological Service.

As noted recently in the ELECTRIC RAILWAY JOURNAL, Mr. Ready has been made president of the Key System Transit Company, Oakland, Cal.

D. A. Smith Assistant General Manager at Detroit

Del A. Smith, general superintendent of the Detroit Department of Street Railways, Detroit, Mich., was appointed assistant general manager by the Street Railway Commission on Dec. 7, and will assume the title of acting general manager after the resignation of H. U. Wallace as general manager becomes effective on Jan. 1. Mr. Smith will be acting general manager until a new general manager is appointed.

The appointment of the new assistant general manager was made at a meeting in the Mayor's office at which G. Ogden Ellis, president of the commission, and Commissioners John J. Barlum and H. H. Esselstyn were present. Mr. Smith succeeds as assistant general manager H. M. Gould, who resigned about a year ago.

It has been announced that several applications have been received for the position of general manager from men not now employed by the department. This fact will not bar men already in the service from receiving consideration in filling the vacancy made when Mr. Wallace's resignation goes into effect.

Mr. Smith started his 22 years of experience in the train service of the Chicago, Milwaukee & St. Paul Railroad in Chicago in 1904. The following year he became a conductor on the Jackson Division of the Detroit United Railway. He was made a carhouse foreman in 1907, and since then has occupied the positions of assistant division superintendent, night superintendent, division superintendent, assistant superintendent of transportation and general superintendent. At the time the Detroit United Railway lines were purchased by the city, Mr. Smith was taken into the employ of the municipal system.

Charles L. Sheldon, formerly chief engineer at the power plant of the Holyoke Street Railway, Holyoke, Mass., has entered the employ of the Holyoke Water Power Company. Electric energy to operate the Holyoke Street Railway system was supplied for the first time by the Holyoke Water Power Company on Dec. 5.

W. G. Gove Railroad Club President

Superintendent of Equipment at Brooklyn Third Electric Railway Executive to Hold This Office

William G. Gove, superintendent of equipment of the Brooklyn-Manhattan Transit Lines, has been elected president of the New York Railroad Club. He is the third electric railway man in the history of the organization to be elected to that post. The two others who have served in that capacity are H. H. Vreeland, now of the Interborough Rapid Transit Company and formerly president of the Metropolitan Street Railway, New York, and Frank Hedley, president and general manager of the Interborough Company.

Mr. Gove became connected with the companies in Brooklyn in 1903. Since then the character of much of the service rendered over the lines there has changed tremendously. At the time he went to Brooklyn steam train operation on the elevated had just been replaced by electric and the equipment offered a large field for the standardization of parts on the electric trains. In fact, the standardization of widely varied equipment was the first object of his work in Brooklyn. It was accompanied by drastic changes in the organization whereby the all-around shops intended for territorial operation were replaced by specialty shops for the entire system. This work of standardization of the elevated cars and equipment was undertaken on Jan. 4, 1904, but was preceded by a six months study of the problem and much preliminary work. The task was practically ended in 1906. Mr. Gove's next important work was to standardize the cars of the surface lines. This phase of the work was completed in 1910. During this time 3,425 cars were reconstructed at a cost of more than $4,000,000 and 626 cars were purchased at a cost of $10,000,000. During this interval 704 single-track cars were withdrawn from service.

W. G. Gove

This was a gigantic task. Its completion with the celerity with which Mr. Gove carried out the work would have been impossible to any man less capable as an organizer. In prosecuting the work Mr. Gove assembled one of the finest maintenance organizations in the world. It was here that the man's organizing ability asserted itself. He knows how to delegate authority, but he also has the faculty of keeping closely in touch with all that is going on. His work is directed through his various assistants.

In a changing world, Mr. Gove was not content with revamping equipment and keeping things going. He threw himself into the field of development and original design, and was responsible, among other things, for developing, with the assistance of his associates, the present New York municipal subway and elevated cars, copied throughout the world as models for equipment intended for use in rapid transit service. Articulated units for train operation were a later development. In them novel features never before attempted in car construction were embodied. The low-level center-exit and entrance cars, so long a standard on the Brooklyn surface lines, were also brought out. In addition to all this, Mr. Gove was a pioneer in adopting steel wheels for electric railway service. More recently he has been engaged in directing plans for equipping the new Coney Island shops, the largest of their kind in the world and certainly the most completely equipped. His record in association work, particularly his work in the interest of the American Electric Railway Association, is well known, he being a past-president of the Engineering Association.

Before he joined the Brooklyn Rapid Transit system in 1903 Mr. Gove was with the Boston Elevated Railway. He was born in Cincinnati on Feb. 24, 1874, and was educated in the Cincinnati schools and at the Cincinnati School of Technology, which is now a part of the University of Cincinnati. Immediately after leaving the university he began work in a civil engineer's office and later was engaged in an irrigation project on the Pacific Coast. In July, 1896, he became assistant engineer of roadway for the Cincinnati Street Railway. His connection with the Boston Elevated Railway dated from March, 1899. His title at Boston was assistant engineer. From January, 1900, to May of the same year Mr. Gove had charge of reconstructing the equipment of the trial trains in competitive tests in the old Tremont Street subway, used by the elevated railroad, and by surface cars during the early morning hours when traffic was light. These tests of train operation marked an epoch in electric railway development, as they pointed the way to train operation with multiple-unit equipment. After the tests had been completed and a decision reached as to the type of equipment to be tested, Mr. Gove was associated with Messrs. Winsor and Lindall in constructing and equipping additional cars for this service. As noted previously, he went from Boston to Brooklyn in 1903.

J. Paul Thorne has assumed his new duties as safety director of the Monongahela West Penn Public Service Company, Fairmont, W. Va. Since the resignation of the former director, James E. Hendry, the assistant director, has been in charge of the movement.

William B. McKinley

Former Head of Illinois Traction System Dies at Age of Seventy—Had Lately Been Illinois Power & Light Chairman

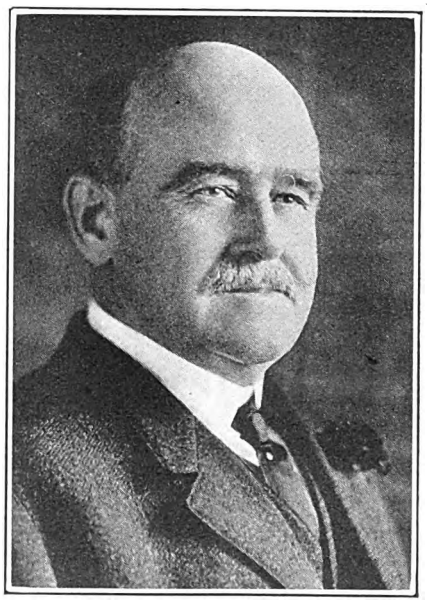
SENATOR WILLIAM B. McKINLEY, utility magnate, banker, world traveler, economist, philanthropist and politician, died at the Homelawn Sanitarium in Martinsville, Ind., on Dec. 7. Mr. McKinley's death had been expected for several weeks as he had been suffering with an incurable illness for many months. The remains will be taken to Indianapolis and sent to Champaign, Ill., his former home, for burial.

Though known to many for his charity and for the influence he wielded in politics, he was especially prominent in business circles for his activities in various utility enterprises. One of the most noteworthy of these was his affiliation with the Illinois Traction Company, whose many subsidiaries cover Illinois, Iowa, Kansas and Missouri. A few years ago he disposed of a large part of his holdings in the company, but was made chairman of the board of the Illinois Power & Light Corporation. The McKinley interests, of which he was the head, controlled 500 miles of track, with its own bridge across the Mississippi River at St. Louis and a terminal in the heart of the city. This was the high spot in a utility career which began in 1884, when Mr. McKinley was 28 years old. He saw great possibilities in the mule car line operating between Banner and Champaign, a distance of 2 miles, and interested Eastern capitalists in the matter and bought the road. Under his auspices the property was electrified and extended. Later he bought the interurban line between Springfield and Defiance, Ohio, and still later the utility property at Bay City, Mich. Then he turned his attention to the Danville system. These properties became the nucleus around which grew the powerful Illinois Traction System, one of the most important of the early utility groups with properties in several states serving a vast population with electric railway, electric light and gas service.

MAN OF WIDE INTERESTS

In addition to his utility endeavors, he had been for a number of years a deep student of political questions and of economics and had made himself an authority on matters involving foreign relations. He had traveled very extensively and had gained an accurate conception of conditions in various parts of the world. Some years ago, accompanied by a party of friends, he went on a trip around the globe, spending a considerable time in each of the principal foreign cities.

Senator McKinley had been frequently before the limelight in spite of his quiet ways. In 1920 he scored an overwhelming victory over his Democratic rival for United States Senator from Illinois. His election and nomination were a great personal triumph for he was the only opponent of the state political machine of Mayor Thompson of Chicago to win a nomination at the primary election held some time before that. This election came as a climax to a long political career. He was elected to the House of Representatives in 1904 and served continuously until 1912. He was returned to the House in 1914, where he continued until 1920, when he was elected to the Senate. In the primaries this year he was defeated by the present Senator-elect, Col. Frank L. Smith, over whom he had triumphed six years ago. He entered this contest with his accustomed vigor, but the strain of the campaign is believed to have enfeebled him greatly. His defeat in the primary came on the heels of the Senator's vigorous stand in favor of American adherence to the world court protocol and brought to a close a Congressional career of twenty years, fourteen of which were spent in the House of Representatives.



William B. McKinley

Mr. McKinley was born in Petersburg, Ill., on Sept. 5, 1856. When he was a very young lad his family moved to Champaign, where his father was the pastor of a small Presbyterian congregation. He entered the University of Illinois, but after two years left to become a clerk in a drug store. Later he worked in a similar capacity in a real estate office. Following a short banking experience, he became associated with his uncle, J. B. McKinley, in the farm loan business, branching out in 1884 to enter the utility field.

At the time of the panic in 1893 Mr. McKinley had considerable money invested in farm mortgages in Kansas and disposed of most of the utilities which he had bought. Three years later, however, he re-entered the public utility field by building an 11-mile electric railway to Joliet. Within the next three years he bought and modernized the street railway lines in Quincy and Galesburg and constructed an interurban railway to Knoxville. Having accumulated a large fortune after knowing in his youth and boyhood the hardships of life and later the uncertainties of all forms of business, Senator McKinley was very generous in the time of his prosperity to educational and other institutions designed to assist struggling youth. Nor were his benefactions confined to the large gestures of philanthropy. According to C. A. Willoughby, his secretary, in the last eight or ten years he probably donated between $10,000,000 and $12,000,000 to public and private charities. This takes no account of his personal generosities.

T. W. Shelton

Thomas William Shelton, general manager and purchasing agent of the Illinois Central Electric Railway, Canton, Ill., died on Nov. 15. He had been affiliated with the Canton properties since 1918, when he resigned as general superintendent of the Kankakee & Urbana Traction Company, in Urbana, to accept the general superintendency of the Canton road.

Mr. Shelton had been engaged in electric railway and electric lighting work for approximately 38 years. His first railway connection was with the old Brooklyn Street Railway in Cleveland, where he remained ten years. Two years service followed with the Indianapolis Street Railway. Next he became associated with the Northern Ohio Traction & Light Company, now the Northern Ohio Power & Light, where he served from 1900 to 1904. He aided in the construction of the line of the Fort Wayne & Springfield Traction Company between Fort Wayne and Topeka and served the company both as mechanical and electrical engineer. In 1908 he went to the Indianapolis, Columbus & Southern Traction Company, Columbus, Ind., as master mechanic. Two years later he entered the service of the Illinois Traction System under E. D. Bell, general superintendent of the St. Louis business of the company. Thence it was he went to Urbana, where he was to remain about five years. Mr. Shelton was born in Ontario, Canada, in 1861.

Thomas C. Coleman, head of T. C. Coleman & Son, railway supplies, died recently in Louisville, Ky.

Henry J. Arnold, one of the organizers of the Durango Street Railway and a promoter of the western slope's first electric railroads, died at Denver on Nov. 22, aged 60. Mr. Arnold was a native of Clinton, Mo. He settled in Colorado in 1880. He was a director in many business concerns and an untiring worker for the advancement of the civic beauty of Denver, of which he was at one time Mayor.

Charles F. Morse, identified with the promotion of the Kansas City Belt Railway, died in Boston, Dec. 1. Mr. Morse was a former officer of the Metropolitan Street Railway, Kansas City, Mo., a predecessor of the Kansas City Railways and the Kansas City Public Service Company. He was 87 years old.

It Isn't Too Early to Think About the Cleveland Exhibit

Plan now for your convention exhibit at the A.E.R.A. show in Cleveland next October! Freddie Dell, director of exhibits, is already under way on his program. His first release was issued under date of Dec. 4. Next October may seem to be a long way off, but the present is budget time for 1927, and to be forewarned is to be forearmed.

While exhibit facilities at Cleveland last year far surpassed those available in other cities, the Cleveland convention committee, Col. J. H. Alexander chairman, has assured the association that these facilities will be much improved for the coming convention.

The fact has been stated before, but it might be well to reiterate, that the exhibit will take place in the Cleveland Public Auditorium and the Auditorium's west wing, both buildings being required to accommodate the display.

The exhibit feature of the convention has grown in importance each year. The space occupied by exhibits at the last convention totaled more than 119,000 sq.ft. Ninety-seven buses and chassis were on display. Forty-one street and interurban cars were shown, and in addition many important accessory concerns displayed products of interest to the transportation industry. There were 271 exhibitors in all.

Diagram of the exhibition spaces will be available for distribution to the membership on June 1, 1927, together with applications for space.

The dates of the convention, by the way, are Oct. 3 to 7.

New Coaches in Service in Atlanta

Ten new single-deck de luxe coaches were placed in commission on Nov. 29 to supplement the present coach service to Morningside and the Virginia-Highland Avenue sections of Atlanta by the Atlanta Coach Company, a subsidiary of the Georgia Railway & Power Company. The new coaches seat 21 passengers, and as they are smaller than the double-deck coaches now in use and considerably more flexible in traffic they are expected to provide improved service for patrons on the two routes.

The color scheme of the new coaches is flamingo red and cream, with black trimming, similar to the double-deck coaches in use. Entrance and exit are from the front of the coaches and they are equipped with a six-cylinder, sleeve-valve motor. Each coach is upholstered in real brown leather and finished in the interior with mahogany. The floor is covered with green battleship linoleum and each coach is equipped with four hydraulic brakes, as well as an emergency hand brake. A feature of the new coaches is the lighting system, consisting of eight dome lights. A heating and ventilation system forms a part of the construction.

The new coaches were manufactured by the Yellow Coach Manufacturing Company.

Jury for Harvard Advertising Awards

Dean Donham of Harvard Business School Names Twelve Jurors to Make Awards for Year 1926

The jury to decide the 1926 winners of Harvard Advertising Awards, the series of annual prizes founded in 1923 by Edward Bok, has been announced by Dean Wallace B. Donham of the Harvard Business School, through which the awards are administered. The jury will convene in Boston the middle of January to make the awards for the year 1926.

The following awards for 1926 will be made: Prizes of $2,000 each, for the most excellent national campaign, for the most excellent campaign of industrial products, for the most excellent local campaign, and for the best campaign executed locally in cities of 100,000 population or less; a prize of $2,000 for the advertising research most conspicuous for bringing about economy or precluding waste; four prizes of $1,000 each for the advertisements most effective in the use of text, in the use of pictorial illustration, in the combination of text and illustration, and in the use of typography, respectively.

In addition a gold medal will be awarded to the individual or organization deemed by the jury of awards to merit recognition for distinguished contemporary services in the field of advertising.

All material to be submitted for the awards for 1926 must be in the hands of the Harvard Business School on or before the last day of this year.

Those who will serve on the award jury are: John Benson, of Benson & Gamble, Chicago, advertising agency; S. E. Conybeare, assistant sales manager of the Armstrong Cork Company, Lancaster, Pa., and president of the Association of National Advertisers; F. C. Kendall, editor of *Advertising and Selling Fortnightly*, New York; W. D. Moriarity, professor of economics University of Southern California, Los Angeles; A. C. Pearson, treasurer of the United Publishers Corporation, New York; Harford Powel, Jr., editor of the *Youth's Companion*, Boston; Louis Wiley, business manager of the New York *Times*, and Prof. Melvin T. Copeland and Assistant Prof. Neil H. Borden of the Harvard Business School.

A special jury to make the award for the advertisement most effective in the use of typography has also been appointed, to consist of Joseph M. Bowles of the William Edwin Rudge Company, New York printing house; Everett R. Currier, president of Currier & Harford, Ltd., New York, and D. B. Updike of the Merrymount Press, Boston.

Efficient Track Switch Heater Developed

A new track switch heater, developed and placed in service by the Westinghouse Electric & Manufacturing Company, is said to aid greatly in helping to solve the problem of keeping the switches open on steam railways and rapid transit systems during severe winter weather.

The heaters are dropped between the ties close about the switch so that there is about 1 in. to 1½ in. between bottom of rail and top of heater, one heater being placed in front of the switch blade. After once installed they can be left for the winter in continuous service with only occasional inspection. They may be hooked up 14 in series across 660 volts, or coupled

Switch Heater Operating Under Severe Weather Conditions

Digitized by Google

in other arrangements depending upon voltage.

This switch heater is easily accessible for maintenance and installation and is so designed as to prevent moisture from entering the interior of the heater.

Bids for Philadelphia Car Equipment Opened

Three bids were opened on Dec. 3 by Director Ehlers for electrical equipment of cars for the Broad Street subway, Philadelphia, Pa. There are 312 separate equipments for the 150 cars being built by the J. G. Brill Company.

The American Brown Boveri Company, Camden, N. J., was low bidder at $741,000. Next to it was the Westinghouse company, $776,566, and the high bidder was the General Electric Company, $811,200. Director Ehlers said he would announce the award later.

Sesqui Medals Awarded Westinghouse Company

The executive jury of awards of the Sesqui-Centennial International Exposition at Philadelphia voted to the Westinghouse Electric & Manufacturing Company nine awards for its exhibits, including a grand prize for "Excellence of products and service to humanity." Other than the grand prize, the awards include one medal of honor, four gold medals and three silver medals.

$500,000 Seattle Terminal Approved

The City Council of Seattle, Wash., has passed, without a dissenting vote, the ordinance granting the Pacific Northwest Traction Company the necessary franchises to move its Everett interurban terminal to a new location on Stewart Street, where a $500,000 building will be erected. A. W. Leonard, president of the Puget Sound Power & Light Company, parent concern, states that work will begin at once. The traction company operates an interurban line from Seattle to Everett, a bus line from Everett to Mount Vernon and another interurban line connecting Mount Vernon and Bellingham, all of which will be served in the new terminal building.

Metal, Coal and Material Prices

Metals—New York	Dec. 7, 1926
Copper, electrolytic, cents per lb.	13.35
Copper wire, cents per lb.	15.75
Lead, cents per lb.	7.90
Zinc, cents per lb.	7.35
Tin, Straits, cents per lb.	69.50
Bituminous coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$7.00
Somerset mine run, Boston, net tons	3.00
Pittsburgh mine run, Pittsburgh, net tons	2.20
Franklin, Ill., screenings, Chicago, net tons	1.75
Central, Ill., screenings, Chicago, net tons	1.525
Kansas screenings, Kansas City, net tons	2.30
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$6.00
Weatherproof wire base, N.Y., cents per lb.	17.50
Cement, Chicago net prices, without bags	2.10
Linseed oil (5-bbl. lots), N. Y., cents per lb.	11.4
White lead in oil (100-lb. keg), N. Y., cents per lb.	14.75
Turpentine (bbl. lots), N. Y., per gal.	$0.90

The franchise ordinance has been pending in the City Council since July 19. Some weeks later the project was delayed when the City Council returned the matter to the committee on franchises. It extends from Dec. 31, 1934, to Dec. 31, 1950, and authorizes the company to build a double track extending from its present terminal on Stewart Street to the new building site, two blocks away. Under the present franchise the company pays the city 10 cents a car-mile for use of the tracks. Under the new franchise the minimum charge will be 10½ cents and the maximum rate 15 cents during the period of the sixteen-year extension. An amendment to the bill provides for an additional car-mile charge in the event the city builds either an elevated or subway line over any of the route used by the railway.

Car Contracts Awarded in San Francisco

Contracts for the construction of fifteen new cars for use on the lines of the Municipal Railway have been let by the Board of Works of San Francisco. These cars are to be delivered in six months time and are to cost, exclusive of engineering and inspection, $18,500 each.

At the office of the city engineer it was said that the cars are badly needed, as the number of passengers is increasing daily. Present cars will not be retired as none of these has as yet outlived its usefulness.

The Municipal Railway management requested the new cars more than a year ago, but it was not until Nov. 26 that the final approval of the request was granted.

These fifteen cars will be of the modified California semi-steel type, each with a seating capacity of 52. Contracts for the new cars have been let as follows: Brakes, Westinghouse Traction Brake Company; motors, Westinghouse Electric & Manufacturing Company; trucks, J. G. Brill Company, and bodies, St. Louis Car Company.

Weight, total	51,250 lb.
Bolster centers, length	20 ft. 10 in.
Length over all	47 ft. 1 in.
Truck wheelbase	4 ft. 10 in.
Width over all	9 ft. 3 in.
Height, rail to trolley base	11 ft. 5½ in.
Body	Semi-steel
Interior trim	Birch
Roof	Arch
Air brakes	Westinghouse SML
Armature bearings	Plain
Axles	Standard EB
Bumpers	Cast anti-climber
Car signal system	Hand-operated bell
Car trimmings	Bronze and aluminum
Center and side bearings	Brill type roller
Compressors	Westinghouse 16 ft
Conduits and junction boxes	Westinghouse
Control	Westinghouse HLC
Destination signs	Hunter
Fare boxes	Johnson
Fenders	Eclipse life guard
Finish	Paint and varnish
Gears and pinions	Westinghouse
Headlights	Golden Glow
Journal bearings	Plain
Journal boxes	Brill
Motors	Westinghouse 306, outside hung
Sash fixtures	Stationary
Seats	Heywood-Wakefield
Seating material	Outside, slots; inside, veneer
Slack adjuster	Westinghouse type J
Step treads	Cast
Trolley base	US-20
Trucks	Brill 76-EZ
Ventilators	Garland
Wheels	Rolled steel, 34 in.

Rolling Stock

Honolulu Rapid Transit Company, Honolulu, Hawaii, has changed its plans on a prospective order for twelve one-man cars, recommended by Richard Sachse, traffic expert, and referred to in the ELECTRIC RAILWAY JOURNAL, issue of Oct. 23, page 792. Instead, the company plans now to purchase eight new one-man, two-man cars at a cost of approximately $136,000. This is in connection with its proposed rerouting and curtailment of service.

Rockford & Interurban Railway, Rockford, Ill., purchased recently at foreclosure by Milton Ellis, who had previously bought all the bonds in default, plans to buy five new cars as one of the first steps in a program of improvement intended to restore the earning power of the road.

Track and Line

Tampa Electric Company, Tampa, Fla., has started the work of constructing its double car lines on the newly acquired right-of-way for the extension of the Bay Shore Drive.

Memphis Street Railway, Memphis, Tenn., will extend the Faxon Avenue line, which at present is single track. It will be extended 2,000 ft. and double tracks will be put in.

Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has extended its Holton-Mitchell Street line on Forest Home Avenue from 26th Avenue to the city limits near 29th Avenue at a cost of $21,086.

New Advertising Literature

Mine Safety Appliances Company, Pittsburgh, Pa., has issued bulletin No. 231 on the M.S.A. paint respirator, a complete protection for paint sprayers.

American Brown Boveri Electric Corporation, New York, N. Y., has issued descriptive circular No. 702 on quick-acting automatic generator voltage regulators.

Ohio Brass Company, Mansfield, Ohio, has issued a folder called "Lighting the Way." It describes the Imperial headlights for electric railways.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has just released three new railway catalog sheets, Nos. 6, 7 and 8, containing descriptions and data on the latest types of railway motor covers, axle shields, gear cases and armature shafts, respectively. Leaflets 20,300 and 20,-301, containing specifications for railway motors, have also been published. These motors are No. 510-E and 508-E, respectively, the first two standard railway motors on which dual ventilation has been used. In addition to the above publications, two folders, F-4,728 and DMF-5,005, have been issued describing the new type of compensating controller fingers designed to give maximum contact between finger and segment on type K railway controllers, with minimum failure from burning.

Devices for Rapid Machining Require Careful Checking

ACCURATE machining of wearing parts is being given more attention by electric railway shopmen than ever before. This is encouraging, as it shows that the revised standards of machining tolerances made by association committees, together with various recommendations for reducing noise by maintaining closer fits, are receiving consideration by the maintenance departments. One railway reports that its stepping for the bearing fits of armature shafts has been reduced one-half. Where previously $\frac{1}{32}$-in. wear was permitted and then the shaft was turned down $\frac{1}{16}$ in. to the next standard undersized diameter, now but $\frac{1}{64}$-in. wear is allowed and the shafts are reduced in diameter but $\frac{1}{32}$ in. to the next step. This practice not only keeps the fits much closer but results in considerable saving in the amount of metal that is turned off to reduce a shaft bearing to the next size.

On another railway property, in checking the accuracy to which armature bearings were being machined, a somewhat surprising fact was disclosed. The bearings were first finished on the outside and the boring was done with the bearing held in a self-centering chuck. It had been assumed that this insured accurate centering of the bore in relation to the outside fit. The checking disclosed bearings with the inside bore out of center from 0.005 to 0.01 in. A bearing that had just been finished in the chuck was marked so that it could be reinserted in the same position. It was then removed and immediately put back in the chuck. Upon starting the boring bar the tool began a cut of about 0.005 in. on one side of the bore.

Use of the self-centering chuck had reduced the time of machining bearings to about one-third that taken when bearings were held in the three-jaw chuck of the lathe. It permitted a slight misalignment, however, so that the bore was not centered accurately. With the old method the machinist did not depend on the holding device for accurate centering and so each bearing was tested carefully for alignment before the boring operation was started. Too great dependence had been placed on the new chuck and inaccurate machining resulted.

Railway Holds First Place in Automobile Manufacturing Center

MORE automobiles are manufactured in Detroit and its environs than in any other city in the world. The employees of this industry far outnumber those of any other industry in the district. On account of the freight differential, automobiles are somewhat cheaper there than elsewhere. Consequently, the automobile has reached the zenith of its popularity in Detroit. It is the more remarkable, therefore, to find that public transportation vehicles are carrying more than 80 per cent of the city's traffic, as was indicated by a recent investigation made by the Retail Merchants' Association.

Street cars were found to be the most important means of transportation, being used by some 56 per cent of all customers at 27 downtown stores. Buses carried slightly more than 24 per cent, while only about 19 per cent came by private automobile. Details of this traffic count appeared in last week's issue. No marked differences from trends indicated by similar checks in other cities are to be seen in the Detroit figures, nevertheless it is interesting to note that the electric railway holds the place of first importance even in the heart of the automobile manufacturing district.

Pull-In Comparisons Not Always Reliable

DISCUSSION to no avail arises from data relative to pull-in records for the simple reason that a pull-in in one city is not so counted in another. Then, too, some companies eliminate from the record pull-ins due to service causes such as broken windows, minor damage because of collision, etc. Master mechanics on other properties that are doing a good job of maintenance may have their records subjected to an invidious comparison because of their companies' policy of counting all pull-ins, whatever the cause, as a basis for determining the pull-in records.

At the meeting of the Iowa operators in Omaha last month the question of car-miles per pull-in was often referred to, the values, however, varying from a few thousand to 20,000. Last summer at the Chattanooga meeting of the Southern Properties' equipment men records of car-miles per pull-in were reported and published in the JOURNAL varying from 5,000 up to 98,000. It seems reasonable to suppose that the methods of determining pull-ins must vary widely in order to obtain such different results.

Comparative records are always of value when made on the same basis. When such a basis does not exist such records are worse than useless. It is far from a simple matter to determine a standard basis for counting pull-ins. On some properties cars are turned in for the slightest failure, while on others repair men fix damaged parts on the road. This difference may even exist on various divisions of the same property. There is also considerable variation due to the character and condition of the equipment and the type of service in which it is used. Old cars manifestly will be expected to give more trouble than new ones. Four-motor cars would be expected to develop more defects than two-motor cars. Such differences as these are

This is the issue in December that is devoted essentially to maintenance and construction subjects

Digitized by Google

likely to overshadow variations in operation by the individual motormen.

For determination of the total record there is some background of opinion for counting every pull-in without reference to cause. These pull-ins can be analyzed to determine those arising from traffic accidents, shop failures or inspection failures. Even on this basis there will be some difficulty in determining a standard, although if no attempt be made to use the figures as a means of discipline much valuable information may be obtained from them.

Robbing Peter to Pay Paul Is an Expensive Proposition

FEW will deny that a broad and intelligent program of improvement in shop practice must carry with it an equally comprehensive modernization of shop equipment. But, having agreed on this central thesis, any given number of individuals will at once split asunder upon the rock of accomplishment. Those there will be who favor encouraging the local inventive talent to be found within the ranks of their own shop forces—in other words, the home manufacture of machines and devices which are at all within the range of the shop equipment at hand.

Some almost uncanny fascination seems to invest this doctrine of self-sufficiency; it grows upon one. Soon the shop superintendent who started out to build a machine or two for some specific purpose will find himself exercising much ingenuity in devising equipment which at best will accomplish nothing more than any one of a number of machines already on the market. This is assuredly left-handed economy. By far the greater number of progressive mechanical men recognize it as such. Yet in an astonishing number of shops throughout the country one finds the "home-made prodigies" continuing to blossom out with distressing frequency.

Shop forces and shop equipment have certain inalienable duties to perform. Their existence is justified only on the score of their ability to keep the rolling stock in a condition as efficient as possible. Diverted into channels of competition with established equipment manufacturers, they are shooting far from the mark. True, there are isolated instances where a special type of machine has been needed to accomplish a certain function and where such a machine has not been available, nor have there been sufficient funds at hand to purchase it. Here the home-made device has played a valuable rôle. It should be obvious, but apparently is not, that local talent cannot hope to turn out equipment for standard purposes that will function as efficiently as machines which have been produced by manufacturers after large sums have been expended in research and development work.

It should be possible to determine quite accurately the economies which the introduction of new shop equipment will effect in any given service. Minute operating data have been compiled by the manufacturers and are available to railway executives. These, in comparison with records which are generally kept on existing machines, will give the desired information. On the other hand, it can scarcely be determined in advance whether a contemplated piece of home-made equipment will actually save money, or simply will serve to gratify the ego of its proud inventor.

$10 for Improved Car Appearance May Result in $100 Increased Income

FROM the animated discussion given to the subject of improving car appearance at the recent meeting of the rolling stock committee of the American Electric Railway Engineering Association it is evident that increased attention is being given to car cleaning and painting methods. The general opinion expressed was that cars can be painted much more cheaply if the work is done at frequent intervals and that the added attractiveness of cars which results from frequent painting increases car riding to a marked extent.

As an example of what can be done through shortening painting intervals one superintendent of equipment stated that from 1923 to 1925 his company has increased the number of revenue cars painted annually from 33 per cent to 82 per cent of the total and at the same time the cost of painting has been reduced 75 per cent. Cars on this system are now painted every ten to twelve months. Of course not all of this decrease in painting cost is the result of more frequent painting. The painting system has been changed, the number of coats has been reduced, the spray is used wherever possible instead of the brush method, a simplified color scheme has been adopted and the schedule of painting operations has been standardized. However, the decreased time between paintings has made it possible to use more economical painting methods and still keep the cars in a more attractive condition.

Improved car cleaning methods help to keep the painted surface in good condition. Certainly there is no feature that will add more to the appearance of car interiors than cleanliness. Spray washing and high pressure washing are being used more extensively than ever before. By giving particular attention to car cleaning problems cars are cleaned now at much shorter intervals without increasing the total cleaning cost. Many railways clean their cars thoroughly every night, while there is a periodical cleaning once a month, at which time particular attention is given to upholstered seats and parts that are somewhat inaccessible.

It thus appears that a considerable increase in attractiveness of cars can be produced without an increase in maintenance costs. Certainly the added revenue that is sure to result will warrant expenditure of modest sums for more modern painting and cleaning equipment. Added attractiveness to cars will aid materially in winning back former patronage and the visual invitation of clean, well-painted cars will create an instinctive desire to ride.

What Are Our Future Equipment Executives Doing Today?

HOW may we gain recruits for our equipment forces —particularly from among the younger generation who later must provide the group from which the equipment executives of the future will be selected? This is indeed a problem which is facing not only electric and steam railroad companies, but many industrial organizations as well.

With the present general prosperity, all evidence goes to show greatly increased desire for higher education among the youth of the country, with consequent later inclination toward "white-collar" jobs, in spite of the fact that the average mechanic of today makes considerably more money than the average clerk. Social

Digitized by Google

conditions, therefore, are tending, probably more than in the past, to reduce the quota of young men, both of high school and of college education, who turn to mechanical pursuits as a life career.

Electric railways are intimately concerned with this fact, not only because of the constantly increasing need for better men and better minds to cope with the ever-increasing engineering problems in the electric railway industry, but because equipment work furnishes one of the very best training schools for the offices of president, vice-president and general manager on an electric railway system. This may seem strange to some, but the fact is, the equipment department has been the training school of many of the most successful operating railway executives—both steam and electric—of the present day. A man who has had this training has a knowledge of the fundamental mechanical principles of railway operation that he who has not been actively associated with the equipment department hardly, if ever, is able to acquire. This basic knowledge of the tools which a railway has to use in its daily service—cars, track and power—stands the mechanically trained executive in good stead when he has to pass on those questions of labor and finance which are concerned with daily car and train operation.

A Remedy for Congestion Is Known, but Courage Is Lacking to Apply It

CONGESTION of traffic exists today in the streets of many of our large cities because the municipal authorities do not dare take the steps necessary to afford relief. This was brought out clearly at the December meeting of the A.E.R.A. Metropolitan Section. General agreement that automobile parking is the chief cause of congestion was expressed by the deputy chief inspector in charge of the traffic division of the New York Police Department, by the vice-president of one of the principal street railways in the city and by an executive of a large department store. Notwithstanding this unanimity of opinion as to the cause of the trouble, there was no intimation that action would be taken to relieve the situation.

Many thoughtful retail merchants in New York and elsewhere are awaking to the possibility of decentralization. Because of the difficulty of reaching the downtown shopping district, business is steadily slipping away to the neighborhood stores. These downtown merchants realize that for every customer accommodated by liberal parking rules a dozen, or a score, or hundreds are inconvenienced. They see that the salvation of the big stores lies in the efficient operation of public transportation systems which are used by the large majority of their customers.

The surface transportation systems, which carry 40 per cent of the total traffic in New York City, cannot function efficiently when anywhere from a quarter to a half of the available roadway space is devoted to parking. There is not sufficient room left for moving vehicles. Yet his Majesty the automobilist continues to be allowed to do as he pleases about obstructing the street.

From the remarks of the deputy chief inspector it appears that the evils of present conditions are well understood by the Police Department. But the police are powerless to do anything about it. "Unless help comes from some source, and comes quickly," the inspector said, "we will see traffic completely tied up in certain parts of this city." What a confession to come from the head of the traffic division of the largest city in the United States! The seriousness of the situation is recognized, the remedy is known, but the municipal authorities have not the courage to put it into effect.

Political Bungling Jeopardizes Chicago's Transportation

EVENTS in the Chicago situation have been moving so rapidly in recent weeks that it is difficult to predict what the next development will be. One thing, however, stands out and characterizes the entire series of proceedings. No cleaner-cut example of political inefficiency can be found than in the present Chicago transit situation. Here is a group of companies comprising the largest surface lines system in the world. It has continued to rise in the very face of expiring franchises and maturing bonds, to the highest state of perfection in its history.

Despite the political situation, the service has been improved by the purchase of 445 new cars within the last four years. The companies under the operating agency of the Chicago Surface Lines have shown progressiveness in modernization programs that have relieved traffic congestion in the famous Chicago Loop, and otherwise have rendered a service generally proclaimed to be the best in the country. Both earnings and wages have been increased, and instead of allowing an atmosphere of discouragement and despair to prevail, the business has been conducted in an orderly manner and with that quiet efficiency that has met with the popular approval of the patrons served.

In fact, all of the elements necessary for adequate transportation are within easy reach. Only the handicap of expiring franchises hampers the economic growth of this great group of properties. Capital and management have done their best; but the evils of the short-term franchise, with the management harassed by self-seeking politicians, threaten the continuance of this valuable public service.

The city of Chicago has not shown a lack of interest in the situation. Many reports have been made, much testimony has been listened to, innumerable committees have been appointed. By referendum vote two proposed solutions of the difficulties have been defeated. The fact remains, however, that Chicago to-day is without a plan of settlement, and the franchises have but one month to run in the coming year. With their expiration the underlying bonds fall due with no basis on which to refinance. So also the agreement of joint management of the four underlying companies comes to an end.

It is useless to predict the future. The protection of the courts has been invoked. That is only a temporary expedient. Whether or not a plan can be worked out depends on co-operation by the city and a change in attitude, not yet in evidence. At best the management and capital that performed with such faith the service so necessary to Chicagoans will be jeopardized.

The real contribution that makes for success or failure is one of management. Any one can provide transportation, but only the trained management with adequate protected capital can provide the kind of transportation that will meet with success in present day life. Certainly justice and common sense alike demand the support of operators who have had a record of accomplishment like those in Chicago.

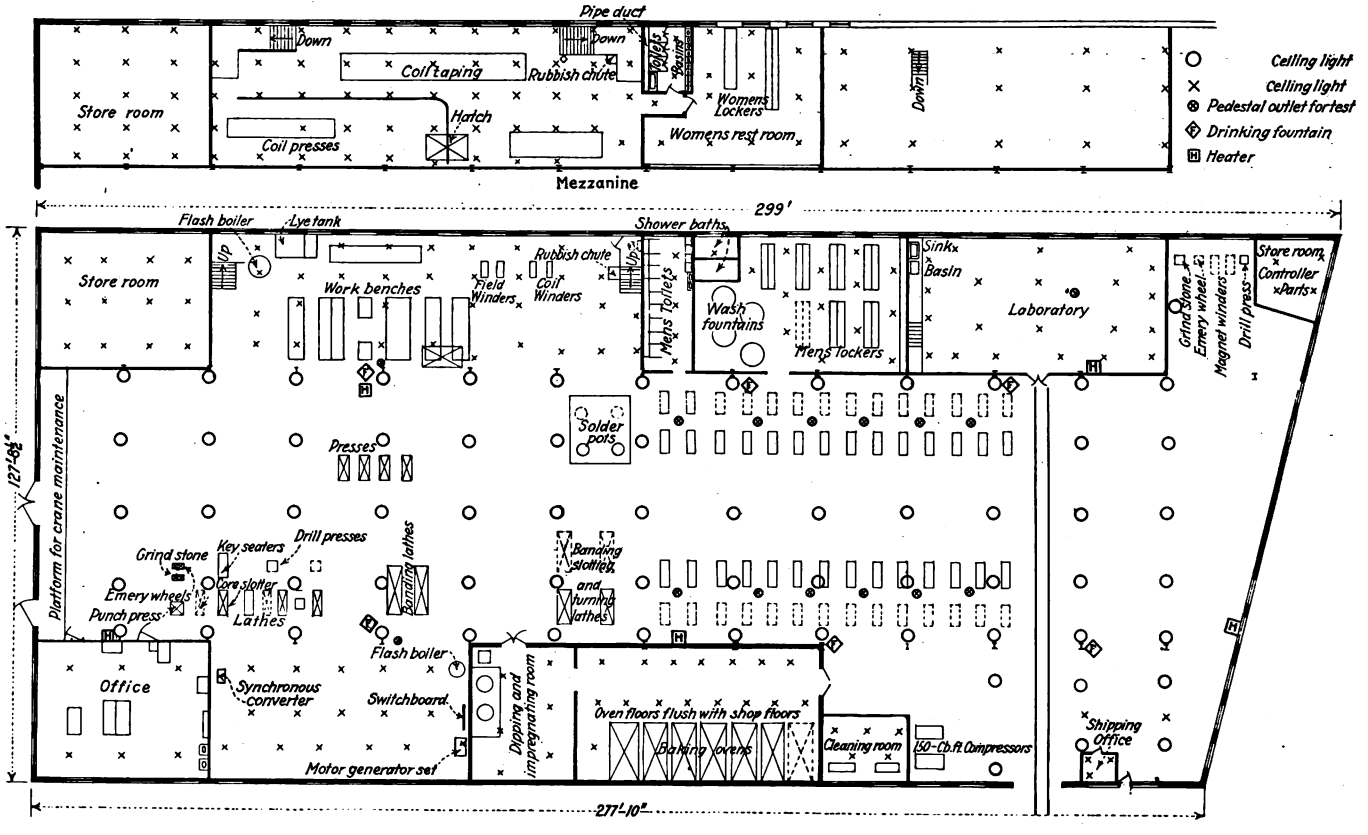
The Electrical Repair Building Is the First of the New Coney Island Repair Shops to Be Used by the Rapid Transit Division of the Brooklyn-Manhattan Transit Corporation — Ultra-Modern Equipment Installed for Making Repairs Quickly and Efficiently

CAREFULLY fitted out with the latest types of machine tools and other equipment needed for electrical repairs, the first unit of the new Coney Island repair shops of the Brooklyn-Manhattan Transit Corporation is in use. When completed the entire group will form the largest and best equipped electric railway inspection and repair shops in the world. Seven buildings are now in the course of erection, with a total floor area of nearly 13 acres. They comprise a main repair shop, an inspection shop, the electrical repair shop, which is the subject of this article; a two-story storehouse, a two-story office building, an oil house, and a boiler house. The total floor area of the seven buildings is 546,000 sq.ft.

The buildings themselves are being built by the city of New York under subway contract No. 4, while the railway company provides the equipment, including heating, lighting, power, machine tools, cranes, elevators, etc. The building now used for the department of electrical repairs is the first one to be completed and the city is now proceeding with the construction of the remainder of this comprehensive group of repair and inspection shops. The yards for these shops occupy the entire space between the Sea Beach and Culver lines of the railway at Avenue X and extend south to Coney Island Creek. The electrical repair shop occupies the northeast corner of this area immediately adjacent to the Avenue X station of the Culver line and but a short distance from the 86th Street station of the Sea Beach line. The shop building is 300 ft. long and 127 ft. wide. The central portion is open from floor to roof and a mezzanine floor 32 ft. wide extends along one side of the building with a space for a similar mezzanine to be built later on the opposite side. Particular attention has been devoted to providing large central sawtooth skylights and an unusual amount of wall space for windows so as to make the interior of the shop exceptionally light throughout the daylight hours and a most attractive place in which to work.

The framework of the electrical repair shop is of steel and the walls of tapestry brick with a concrete foundation. The building presents a very pleasing

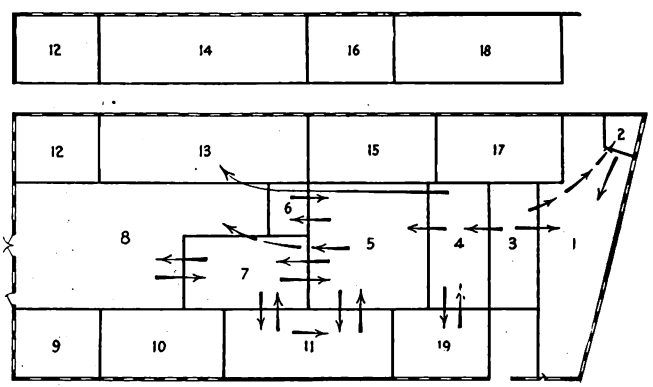


Provision Has Been Made for Expansion and Installation of Additional Equipment to Meet Increased Requirements. The Equipment Indicated by Means of Dots Has Not Been Installed

Digitized by Google

appearance with little attempt at ornamentation. The coping is of terra cotta and window sills are Rowlock brick. Windows are all fitted with steel sash. Ventilating panels in the exterior steel sash are glazed with ¼-in. rough wire glass. Other glazing in the first story is ¼-in. rough glass and the second story exterior steel sash is glazed with clear glass except in the ventilating panels. Roof lights are glazed with ¼-in. rough wire glass. The roof over the center bay is of sawtooth design which furnishes abundance of interior light. The backs of the sawtooth section are of precast interlocking cement tile with glass inserts. The roof over the mezzanine floor and side bay is built of concrete slabs on steel with asphalt surfacing. The floor of the mezzanine section is of cement with an asphalt finish. The ground floor is of Carter Bloxonend flooring on a concrete base.

Unit heaters are located at intervals around the shop and wall radiators where required in rooms, etc. The heating system is of low-pressure type with vacuum return, steam at about 5 lb. pressure being used. Steam is now supplied from a temporary boiler, but



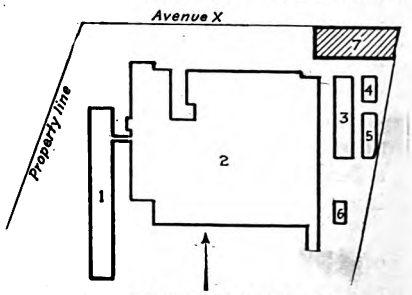
Departments Are Grouped so that Work Moves Progressively. Operations Performed in the Various Sections Are Given in the Table Below

as soon as the main boiler house is completed connection will be made to this.

All electric lighting fixtures are arranged to conform to the latest practice in shop lighting. The central bay is lighted from five-light clusters about 30 ft. above the floor and spaced on 20-ft. centers, each cluster consisting of five 94-watt lamps with porcelain reflectors. Side bays are supplied from single 94-watt lamps 10 ft. above the floor, with porcelain reflectors spaced on 8-ft. by 10-ft. centers. In the washroom and locker rooms 56-watt lamps are used. There are also separate circuits for watchmen's lights, fire apparatus, fire alarm and hydrant designation lights. The 600-volt direct-current system of the railway is used for lighting, five lamps being connected in series across the line.

All wire is run in conduit in the ceilings, floors and walls with pull boxes at convenient intervals. A general lighting and power switchboard is located on the south balcony of the shop. From this the circuits run to separate lighting and power panels at convenient points in the shop. These control panels are provided with Westinghouse safety switches mounted in steel cabinets with hinged doors.

Pipe trenches are provided for the distribution pipes for steam, air, gas, electricity and water. Pedestals are placed along each side of the central section of the shop devoted to stripping and winding of armatures. These pedestals include connections for gas, air at 90 lb. pressure and electricity at 110 volts a.c. and 600 volts d.c. Some further details as to the construction of these stands and the convenience for various classes of work will be given in connection with the shop equipment.



General Layout of Shops

The department of electrical repairs, shown as No. 7, is the first building completed. Others in the group are: 1, Inspection shop. 2, Main repair shop. 3, Storehouse. 4, Office. 5, Oil house. 6, Boiler house.

Electric railway maintenance men will find the new electrical repair shop of the Brooklyn-Manhattan Transit Corporation of particular interest because of the modern equipment provided. The shop is arranged to handle the largest as well as the smallest item of electrical repair work rapidly and efficiently. Quick repairs to electric car equipment are necessary, not only to keep the maximum number of cars in service continually, but also to minimize the number of spare parts that must be stocked.

In planning the department of electrical repairs, particular attention was given to grouping departments and equipment so that the part being repaired will

Schedule of Work in Various Departments of B.-M.T. Electrical Repair Shop

(Figures after section numbers are approximate areas)

Section 1—3,480 Sq.Ft.
For repairs to controller equipment, contactor boxes, switch groups, line switches, magnets and door equipment.

Section 2—277 Sq.Ft.
Control storeroom. Material necessary for repair parts made up in Section No. 1.

Section 3—2,093 Sq.Ft.
Shipping department.

Section 4—1,798 Sq.Ft.
Armature stripping department. Stripping of armatures. Rewinding and repair of coils.

Section 5—3,306 Sq.Ft.
Rewinding of heavy armatures. Soldering and banding of armatures previous to baking.

Section 6—450 Sq.Ft.
Soldering pots. All armature windings above 10 hp. are dipped.

Section 7—1,944 Sq.Ft.
Banding department. Armature banders. Armatures cleaned and slotted.

Section 8—5,466 Sq.Ft.
Machine shop.

Section 9—1,287 Sq.Ft.
Shop offices.

Section 10—1,980 Sq.Ft.
Testing department. Motors and control equipment are tested with high potential apparatus and certain types are given an actual running test.

Section 11—2,040 Sq.Ft.
Dipping and baking room. Impregnating tanks for field coils and all dipping and baking requirements.

Section 12—2,500 Sq.Ft.
Storeroom for insulating material, wire and complete coils.

Section 13—3,170 Sq.Ft.
Field coil work.

Section 14—3,170 Sq.Ft.
Mezzanine floor. Winding room for armatures, magnets and all other small coils, steam coil presses installed so that armature coils can be completed except for dipping and baking.

Section 15—1,920 Sq.Ft.
Men's room.

Section 16—1,280 Sq.Ft.
Women's room.

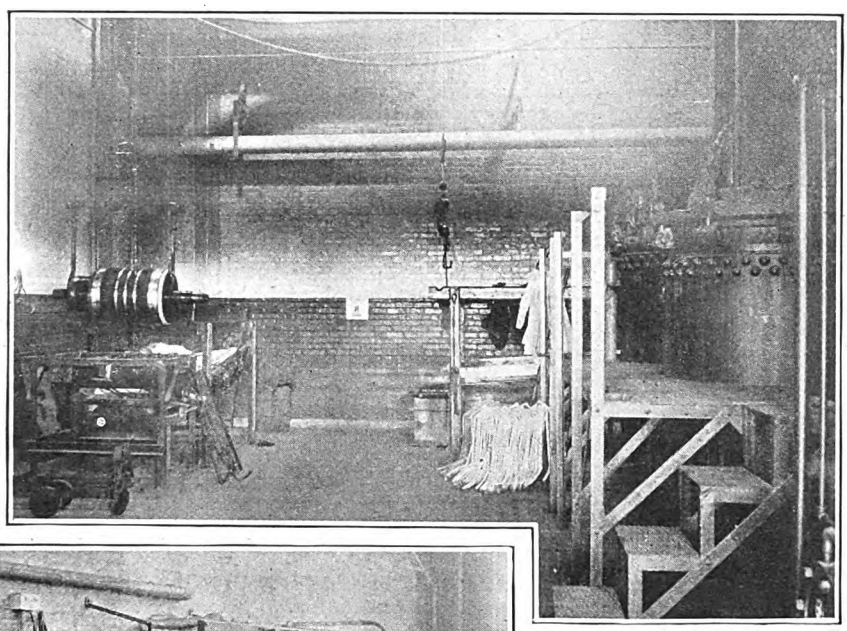
Section 17—1,920 Sq.Ft.
Laboratory. Tests of all material for electrical, maintenance and general repair shops for physical and chemical properties.

Section 18—2,528 Sq.Ft.
Storeroom for laboratory.

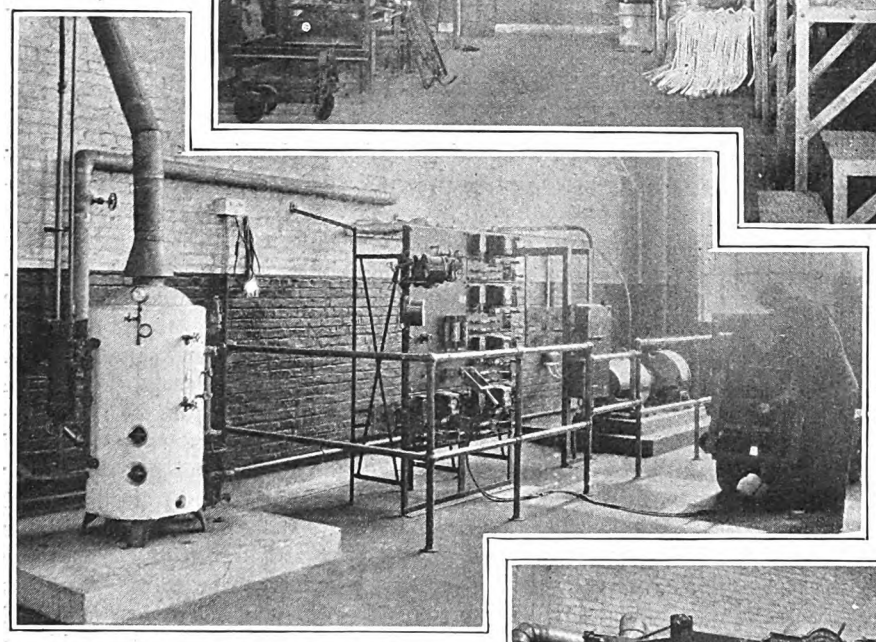
Section 19—1,490 Sq.Ft.
Cleaning room for various motors and control before dismantling.

Digitized by Google

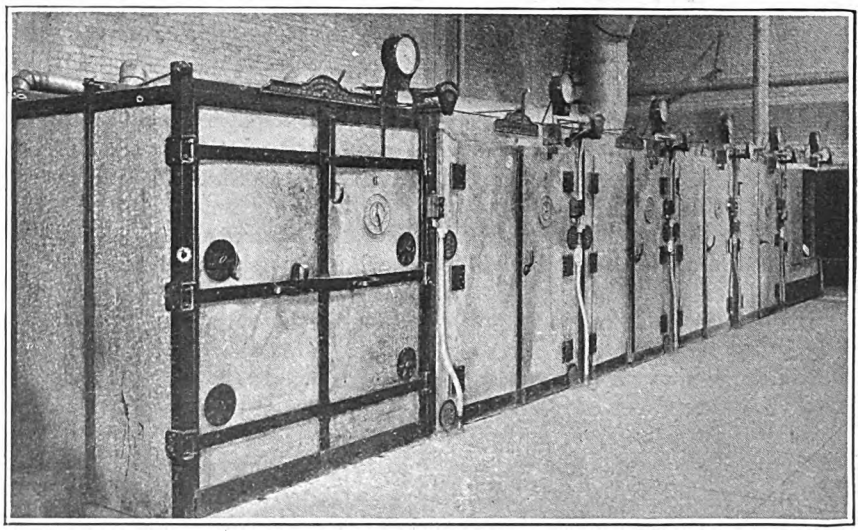
move progressively from one operation to the next and all interference, cross-routing and back-tracking of parts will be eliminated. Provision for expansion and installation of equipment to meet future increased requirements has been made. Plenty of space has been left around machine tools so that equipment can be handled efficiently without interference. Speed in making repairs with an economical shop force has been sought. Quick movement of heavy parts is taken care of by a 5-ton Box traveling crane which spans the central bay and traverses its entire length, by two 1½-ton Box traveling wall jib cranes, operated from the floor, and by several small storage-battery trucks. The wall jib cranes serve the machine tools so that the traveling crane can be used for longer movements and for placing material conveniently to machines.



Equipment for Rolling Armatures in Insulating Varnish Is Shown at the Left and the Impregnating and Mixing Tanks at the Right



The Flash Boiler at the Left Supplies Steam for the Impregnating Room—Batteries of Shop Trucks Are Charged from a Motor-Generator Set with Convenient Switchboard Shown in the Center



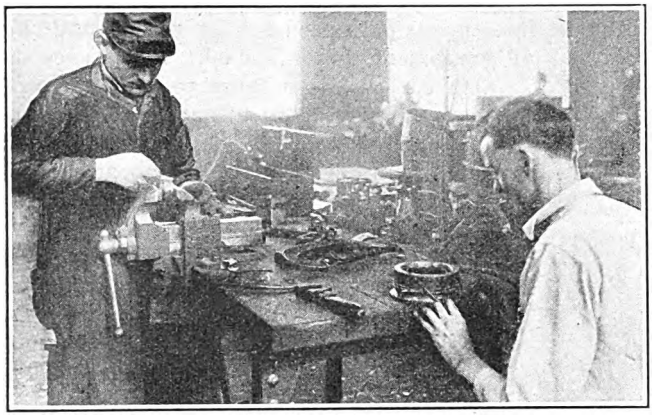
Automatically Controlled Drying and Baking Ovens Are Important Parts of the Equipment

An accompanying plan shows the shop divided into sections so as to illustrate the efficient manner in which work of similar character is grouped. A table lists the work done in each section. Lines with arrows show progressive movement of parts during repairs.

Section 3, with a track over which cars can be brought into the shop, is used for the receipt and shipping of all equipment and material. Armatures, the repair of which constitutes a large part of the work done at this shop, are inspected as they are received and are divided into two general classes—first, those that require complete rewinding, and, second, those that can be repaired without rewinding. All armatures are moved into section 4 by cranes or trucks and are placed on adjustable stands manufactured by the Columbia Machine Works. These have a large steel bell-shaped base with roller-bearing cradles at the top. Two such stands support an armature. One is bolted securely to the floor, while the other is left free to be moved so that adjustment can be made to take care of various lengths. The head with the cradle has a screw bottom with square threads to provide a 10-in. height adjustment. A convenient height used for repair of armatures is with the roller bearings 36 in. above the floor level. In grouping the stands, the stationary ones are spaced 6 ft. apart. A winder's tool box and material stand of sheet steel is attached by hinged supports to the stationary armature stand. This is 15 in. wide, 18 in. long and 8 in. deep. It is provided with a sheet-steel drawer which can be locked. Space is provided in the armature repair section for a double row of winding stands on either side. But one row on each side is in use at the present time.

The armature rewinding and repair section is provided with twelve outlet pedestals. To these are brought pipes containing gas and compressed air and

Digitized by Google



Short Circuits or Grounds Inside or at the Rear End of Commutators Are Repaired at the Bench

the conduit with wires for connection to both alternating and direct-current supply sources. Each pedestal has an upright circular steel base of 8 in. diameter and 29 in. high with a cast steel bottom. On top of the pedestal is mounted a square outlet box, 8½ in. x 8½ in. x 4 in. deep. The four sides are provided with proper fittings so that connection can be made quickly for gas, air, direct current and alternating current. Small brass plates on top of the cover indicate to the workman just which connection is to be used for each supply. There are six of these outlet pedestals, spaced 12 ft. apart, on each side of the armature rewinding and repair section.

Three soldering furnaces mounted permanently alongside the winding stands are used to heat irons for soldering the rear ends of some types of armature windings which cannot be dipped for soldering. Each soldering furnace has a gas connection and burner of sufficient size so that two soldering irons can be heated at one time. The furnaces are made by Charles A. Horn. They are mounted on a strap-iron stand which brings the furnace 2 ft. above the floor.

A Special Room for Cleaning

Armatures sent in for repairs usually need rebanding or new mica V-rings. Some single coils are replaced. If it is evident that an armature can be repaired without rewinding, it is sent to the cleaning room before dismantling. This room, shown as section 19 on the accompanying plan, is 19 ft. 6 in. x 14 ft. 9 in. and has two galvanized iron housings, 3 ft. x 3 ft. x 5 ft. long, into which the largest size railway armature as it rests on a truck can be rolled and be closed in completely during the cleaning operation.

Dust and grease caked solidly are loosened by scraping. Compressed air is played on the armature and a vacuum system sucks away all loose particles. The two receptacles are connected by 12-in. diameter pipes to a 16-in. diameter vertical pipe. The pipe from each receptacle has a damper so that one can be shut off while the other is in use. A hinged door the full size of the front of each receptacle is provided and to support the door as it is being opened a castor is fastened to the bottom corner farthest from the hinged side. The large front door is also provided with a small circular 15-in. door, and there is also a similar circular door in the opposite end of the receptacle. Another rectangular door 12 in. x 36 in. is provided in the side. These openings are for inserting the nozzle of an air hose to blow out the armatures. These cleaning receptacles are also used for cleaning numerous parts of electric car equipment, such as motor parts, controllers and the like.

Suction to remove the dust and loose particles is provided by a motor-driven fan mounted on the balcony, which serves as a roof for the cleaning room. The refuse material is drawn from the receptacles up through the vertical pipe to a Cyclone separator, in which large particles and any heavy material drop down and through an 8-in. pipe to a steel drum 24 in. diameter by 3 ft. high, which is placed in one corner of the cleaning room. The hood from the pipe fits over the top of the steel drum and is held in close contact by a large steel ring so that there is no tendency for the dirt to fly about the room. The top of the Cyclone separator is connected by a large pipe to a large dust chamber. Light particles are drawn through this and to the exhaust side of the fan, where they are blown outside the building.

After cleaning, armatures which are to be repaired are tested at 1,400 volts a.c. with a Westinghouse por-

table transformer box which is arranged to give testing voltages up to 6,000 in steps of 200. The box is brought to the armature to be tested.

Repairing and Rewinding Armatures

With all coils removed, the armature core is repaired. Any sharp corners or rough edges in the slots that might cause damage to the coils are filed and the slots are cleaned carefully to receive the insulating material for the core. The armatures are next moved to section 5 and the commutators are tested with 3,000 volts to ground and 550 volts between bars. Where repairs to the commutator are necessary these are made and the commutator is tightened carefully. Should there be short circuits or grounds inside or at the rear end which cannot be repaired properly with the commutator in place it is pressed off. This is done in section 8. A 200-ton horizontal-hydraulic press made by the Hydraulic Press Manufacturing Company and a Watson-Stillman vertical press of 50 tons capacity do most of this work. A 60-ton horizontal hydraulic press is used for tightening collars, putting tension on commutators while the nuts are tightened and for removing pinions. These presses are also used for pressing shafts in and out and other forcing operations.

Repairs to commutators removed from the armatures are made in section 13. Unless a commutator is in very bad condition it is the practice to replace the same one on an armature. The armature under repairs is set aside meanwhile. With the commutator again in place, the armature is brought back to section 5 for rewinding.

To show the particular uses to which the various pieces of equipment are put in the department of electrical repairs would require a detailed description of each maintenance operation. The principal repairs made to an armature, however, will illustrate the need for much of the equipment. While armature repairs constitute a large part of the work done, the different steps in rewinding and the order in which the work is completed differ somewhat with the various types of armatures. For a large Westinghouse type 300 armature rewinding operations are as follows:

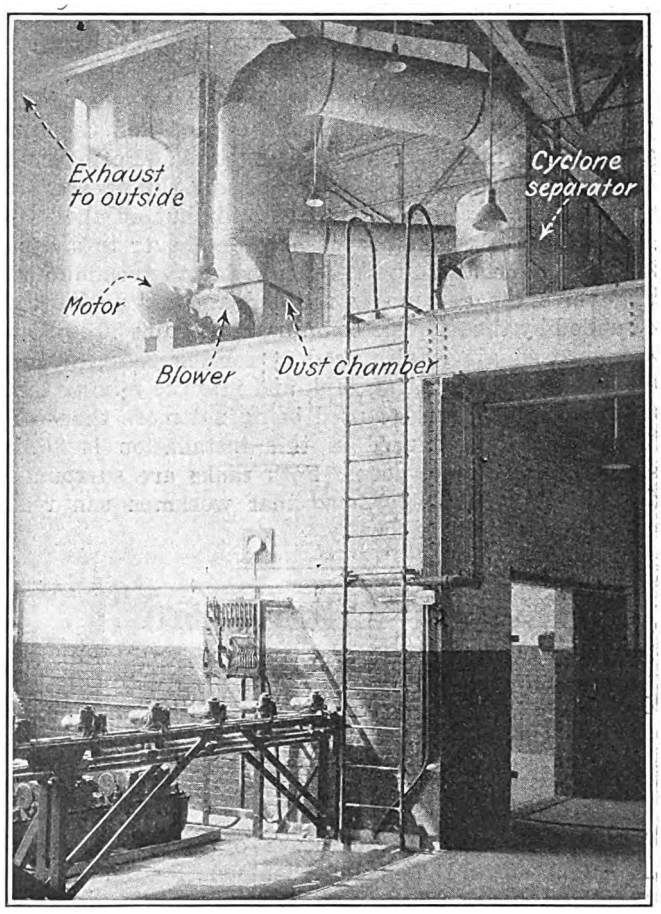
Armature Repair Work Outlined

The winder puts in the bottom coils and tapes them down to hold them in position, properly lined up. The armature is then placed in one of the baking ovens for two or three hours, in order to heat it up. Sticks are then put in on top of the coils and temporary bands are applied while the armature and coils are hot. After cooling, the armature is again placed on a stand in the winding section. The winder cuts the temporary bands and removes them, together with the sticks. Insulation is then inserted above the bottom coils and the top coils are placed in position. The armature then goes into the oven a second time for heating up and again sticks are placed over the coils and temporary bands force the coils down into position. When cold, the armature is again placed on stands and the temporary bands are cut and the sticks taken out. The winder then does the finishing work on the armature and it is given a buzzer test. The armature then goes to the solder pot for the dipping to solder the leads into the commutator neck. After a bar-to-bar test permanent bands are put on and the armature is again submitted to a buzzer test. If this latter test shows trouble in the winding, a bar-to-bar test is made to locate definitely the point of trouble.

The armature then goes into one of the lathes for turning and slotting the commutator. The slots are raked out and the commutator is polished. The armature then is sandpapered and another buzzer test is given it. The core of the armature is then painted and the tape band is given its final coat of varnish. A pinion key is put in the armature shaft and the pinion nut applied. The armature is then ready for service.

Drying and Baking Ovens Important Pieces of Equipment

From the foregoing outline it will be seen that drying and baking ovens are used extensively. These are located in a separate room in section 11, adjacent to which is another room with a complete dipping and impregnating installation. At present six ovens have been installed and there is space for an additional one when the volume of work demands it. Five of the ovens are 10 ft. x 6 ft. 6 in. x 6 ft. high. Their floors are arranged to come flush with the shop floor so that trucks can be rolled directly inside. A sixth oven is arranged for baking coils and small parts. It is 6 ft. x 5 ft. x 34 in. in size. The opening in this oven does not extend to the floor. This oven, together with four of the others, is of Gehnrich Indirect Heat Company's type. The sixth oven, formerly used at the railway's 52d Street shop, was made by the Oven Equipment & Manufacturing Company. The heating and control equipment for all of the ovens was furnished by the Westinghouse Electric & Manufacturing Company. The control boxes are installed on an angle iron framework along the wall



A Motor-Driven Fan and Cyclone Separator Mounted Above the Cleaning Room Remove All Dust and Loose Material

Digitized by Google

of the oven room, directly in front of the ovens. A regulator, used in connection with an indicating and recording meter which is set for definite temperature limits, gives automatic heat control and eliminates the personal element.

The impregnating room has a mixing tank and an impregnating tank, supplied by the P. J. Devine Company, also equipment for dipping armatures by the rolling method and a very complete overhead I-beam hoist system for handling heavy pieces of equipment. Steam at 60-lb. pressure for heating the compound is furnished by a 4-hp. flash boiler made by P. M. Lattner Manufacturing Company. The mixing and vacuum tanks are jacketed for the steam. No pipes are in sight to become covered with compound and make cleaning difficult. The compound is heated in the mixing tank and a partial vacuum is obtained in the impregnating tank by means of air pumps. The equipment to be impregnated is then subjected to a 28-in. vacuum before the impregnating compound is admitted.

With the compound properly heated and mixed, the valve between the two tanks is opened and the compound runs into the impregnating tank. Peepholes in the top covers of these tanks permit the operator to watch the compound as it rises and shut off the valve when the equipment has been covered over to a depth of from 18 in. to 24 in. After closing the communicating valve the vacuum is relieved and air pressure is supplied by the shop air compressor at from 50 to 55 lb. Compressed air is also used in forcing the compound out of the impregnating tank and into the mixing tank, the maximum pressure used being not more than 5 lb. The vacuum tank used in this installation is 36 in. diameter by 56 in. deep. Both tanks are surrounded by an elevated platform so that workmen can reach all parts without difficulty.

Lehigh Valley Transit Modernizes Cars

Interior of One City and One Interurban Car Remodeled to Increase Comfort and Attractiveness —New Seats, Improved Lighting and Pleasing Decorative Scheme Adopted

HAVING faith in the future of trolley transportation within the city of Allentown, Pa., and the surrounding communities, together with a desire to exploit an idea of making the interior of cars more comfortable and attractive induced the Lehigh Valley Transit Company to remodel the interior of two of its cars.

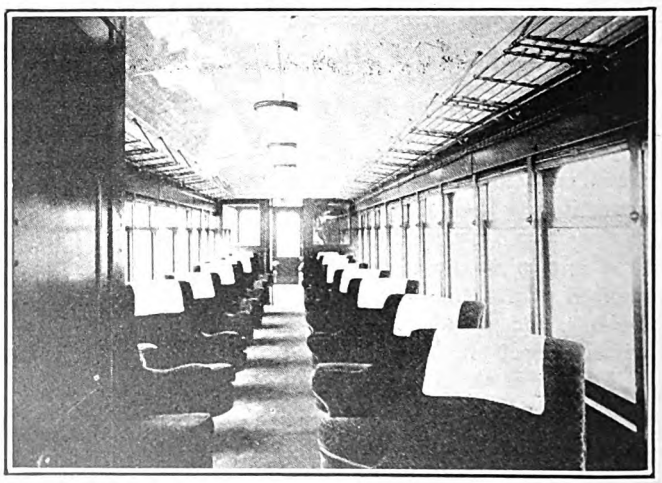
The interior of the chair car which operates between Allentown and Philadelphia was completely renovated. The bell cord traversing the center of the car, which always presented a rather unpleasant appearance, was moved to the side and the many individual ceiling lamps were replaced with five 94-watt compensating dome lights giving a softer and more even light distribution. The compensating panel is located neatly and conveniently in the bulkhead. The fixed fiber chairs were removed and more comfortable green plush upholstered revolving chairs were substituted in the main section, as well as comfortable genuine leather upholstered swiveling chairs in the smoking compartment. A floor covering of green plush carpet with a center runner of Kemi-suede and an interior finish of walnut grain with buff headlining blend with the upholstery and create an atmosphere of attractiveness and cleanliness.

Interior changes of the center-entrance 900 type city car were of a somewhat broader nature. Removal of the rattan seats and the installation of deep-pitched extra comfortable seats, covered with genuine Spanish grain

One of the 900 Type City Cars Has Been Remodeled to Give Greater Comfort

leather, have not only made riding a pleasure but have impressed the riding public. The register rods and pull cords are conspicuous by their absence since their replacement by the electric register system. The dull buff headlining and the five 94-watt compensating dome fixtures give the ceiling a very neat and pleasing appearance. Covering all platform apparatus and piping with metal paneling and camouflaging the bells, buzzers, sign box, reset switch, etc., into the walnut grain finish are other attractive features.

The coal stove has been replaced by electric heaters of the Railway Utility Company's type. Window curtains, which invariably showed signs of rain discoloration, were removed and the top half of the sash glass were



An Appeal to the Car Rider Is Made by the Attractive Appearance of This Remodeled Chair Car of the Lehigh Valley Transit Company

painted brown, giving the external appearance of partially drawn curtains.

The interior of the car, with its walnut grain finish, comfortable seats and the dark tan painted stanchions, metal work and seat ends, presents a very harmonious arrangement and coloring and should act as a stimulant to intensify the riding habit.

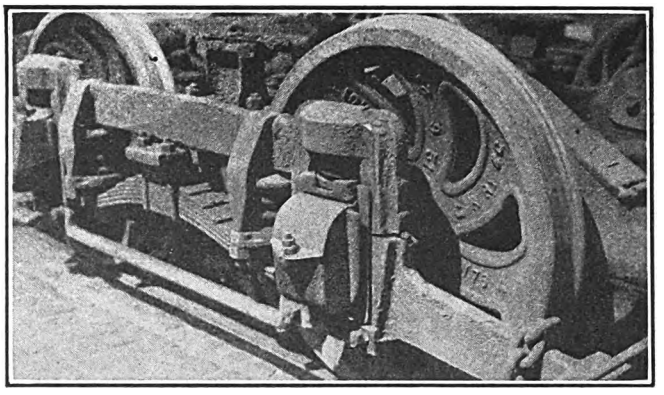
Side View of Brill 27-G Truck Purchased in 1900 Before Rebuilding



This Truck Has Side Frame Broken at Pedestal Jib

Excessive Noise Eliminated by Rebuilding Trucks

Worn Frames Were Built Up by Welding—Pedestal Jaws Were Strengthened and New Type Journal Box with Longer Bearing Was Installed

BY REMODELING and rebuilding some Brill 27-G trucks the Grand Rapids Railway, Grand Rapids, Mich., has decreased troubles in service and eliminated excessive noise. The trucks were standard equipment on cars purchased in 1900 and 1906 and had seen severe service.

In rejuvenating the trucks they were entirely dismantled and the side frames were carried to the welding department, where all worn or cupped portions were filled in and ground off. Considerable trouble had been experienced with these frames breaking through the pedestal guides at the outside end. The driving motors were outside hung and their weight on the extreme end of the truck end frame undoubtedly contributed to this breakage.

To strengthen the side frames at the outside pedestal jaws a piece of 1½-in. square bar steel was welded to the frame so as to form a diagonal brace. This brace extended along the top of the truck pedestal and then diagonally to the outside edge of the side frame, it being fastened securely by welding. Its installation has eliminated breakage at this point.

The cost of welding braces on the side frames of a two-motor truck was as follows:

Material:	
9-lb. Banox welding steel	$2.25
6 gal. kerosene for preheater	.78
226 cu.ft. oxygen	3.05
237 cu.ft. acetylene	6.16
16 lb. of 1½-in. square steel	.53
Total cost of material	$12.77
Labor:	
Preheating welds, five hours	$3.50
Welding, five hours	4.00
Blacksmith work, one hour	0.65
Total cost of labor	$8.15
Total cost of labor and materials	$20.92

In some cases old type motors were replaced by a more modern type where these were available. One of

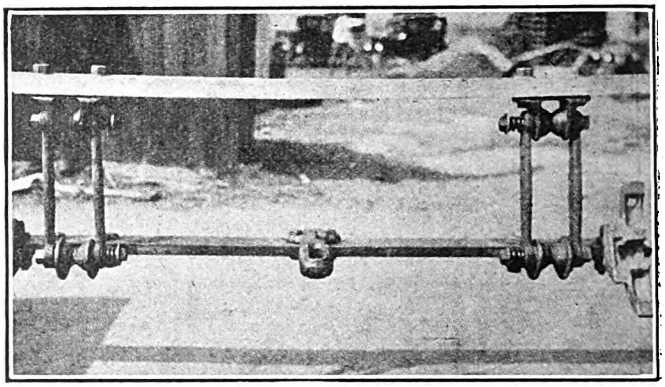
Old Type Brake Hanger and Brake Hanger Carrier



New Type Half Ball Brake Hangers as Installed

the illustrations shows a truck strengthened and rebuilt, with GE-203 motors installed in place of GE-57 motors. This change, of course, required some changes in the type of motor suspension. In order to decrease the vibration and do away with excessive noise fiber insulation was inserted wherever steel is laid on steel. Old type brake hangers and brake hanger carriers were also removed and replaced by half-ball brake hangers with 12-in. centers.

New Journal Box Permits Use of a Longer Bearing

At the same time as the other remodeling was done a new type journal box was installed. With the old type box a 2¾-in. length journal brass was as long as could be used. This type required a check plate. The new journal box permitted the use of a journal brass 7½ in. long. Breakage and troubles from hot journals were done away with due to the increased length. The new journal box also made inspection and lubrication easier and cheaper. The new journal box is No. 333-MCB and it fits into the pedestal jaws without change. With the old type of brass wear was excessive at the end next to the check plate and this resulted in a tilting up of the end. With the new brasses a full length bearing is obtained so that there is much less wear and the results obtained indicated an average of 2½ times as much service from the new bearings as from the old. Strengthening of pedestal jaws has eliminated breakage, new journal boxes and brasses have stopped hot bearings and the fiber insulation has reduced noise.

Details of the Commutator Spider for a Westinghouse 514-A Commutator with the Necessary Gages for Machining and Measuring the Different Parts

Mica V-Rings and Bushings Have Important Functions in Commutators*

The V-Rings Must Be Made of a Bond Which Will Not Squeeze Out Under Pressure, but Which Will Soften When the Commutator Is Heated so the Ring Will Be Plastic

By Jesse M. Zimmerman
Renewal Parts Engineering, Westinghouse Electric & Manufacturing Company

THE mica V-rings used in commutators are different from the mica strips in bond characteristics. Mica used for making V-rings must be made with a bond which is not seasoned completely. The ring must remain plastic to a certain extent in order to give yielding effect to the commutator when it passes through the alternate cycles of heating and cooling.

The shape and size of a mica V-ring are very important features in a commutator. The mold upon which it is made must conform accurately in dimensions to the steel V. If the mold is too large the outer surface of the molded V-ring will wrinkle between the bars, leaving an opening. If the mold is too small the V-ring will break when the commutator is assembled.

Mica V-rings were originally made in one piece the shape of a V, as illustrated in form I of an accompanying illustration. This shape of V-ring did not give sufficient creepage distance from the commutator to the spider for 600-volt railway motors. By making a flange on the ring the creepage distance was greatly increased. But at this stage of development it was impractical to mold this type of ring at a reasonable cost. This led to the development of the two-piece ring as shown by form II.

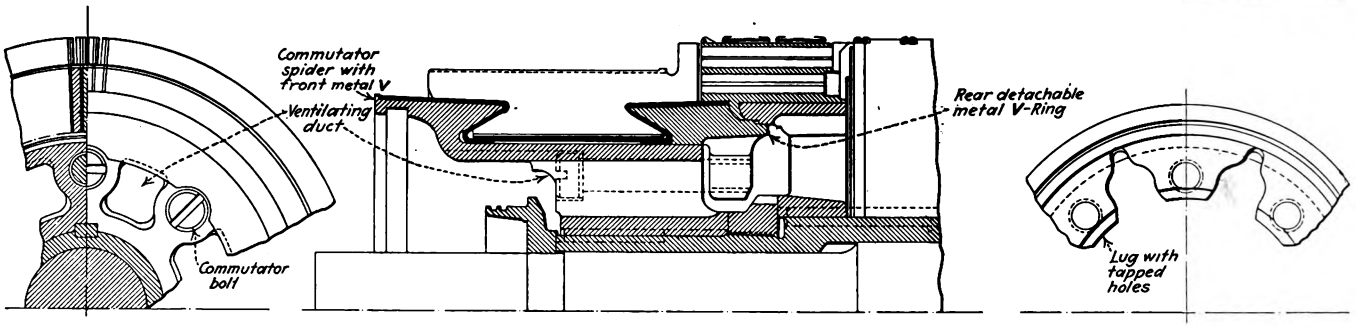
The two-piece mica V-ring consists of a 3-deg. tape bushing and a 30-deg. molded V-ring with a bent flange. The longer the flange the greater was the creepage distance. The copper V's are machined with a groove at the bottom of the V to allow an opening for the joints of the two rings when the commutator is being assembled. Theoretically the joint of the two rings makes a perfect seal. On high voltage motors this joint does not permit sufficient creepage distance. Some trouble was experienced with grounds at this point and this led to the development of a one-piece mica V-ring with a flange, which is being used on all modern railway motors. These are shown as forms III-A and III-B. In molding mica V-rings of this type fingers are cut to enable the mica to be molded around the bends of the flange. Several layers of these strips are staggered accurately in order that the openings between the fingers will be covered by the next layer.

The two-piece mica V-ring was easier to make in small sizes as it was molded from a mica plate which was the exact thickness of the finished ring. These rings have a small variation in thickness of ± 0.001 in. A one-piece ring may have a maximum variation of ± 0.005 in. The reason for this is that the one-piece ring is made of several layers of mica each 0.010 in. thick. Each layer has a variation of ± 0.001 in.

Accompanying illustrations show two mica V-rings, which had been in the same commutator, heated to 150 deg. C. and assembled with 25 tons pressure. A 500-watt lamp was placed back of each mica V-ring. The opening around the flange of the rings was sealed with black paper to keep all light of the lamps from the picture except the light which penetrated the mica V-ring. The views were taken looking directly at the 30-deg. face of the rings. The mica V-ring which has a light circle shows clearly where the pressure of the copper and steel V squeezed the bond out of the mica. The light color shows that the thickness of the ring

*This is the fourth article in this series on commutators. Others were: Choosing Materials for Railway Motor Commutators, published Aug. 8; Important Considerations in Replacing Commutator Bars, published Oct. 23, and Accurate Machining of the V's of Assembled Commutators Is Essential, published Nov. 20.

Digitized by Google



Bolted Type Commutator with Rear Detachable Metal V-Ring

has been reduced by the shifting of bend and mica. At one point the mica in this ring was less than 0.010 in. thick. The other ring shows no signs of light at all. These rings represent what a mica ring should not be and should be respectively.

Important features of mica V-ring construction include: (1) Accurate staggering of the fingers, (2) a bond which will not squeeze out under pressure, (3) a bond which will soften when the commutator is heated so the ring will be plastic, (4) a ring of the same size as the steel V-ring so that the mica will not wrinkle and (5) no slippage of mica in front of the copper or steel V's.

The mica bushing is probably the least thought of in a commutator, yet it has a very important function to fulfill. In order to decrease the diameter of a commutator it is essential that the commutator bars fit close to the spider. By placing an insulating bushing over the spider the distance between the segments and the spider body can be made smaller.

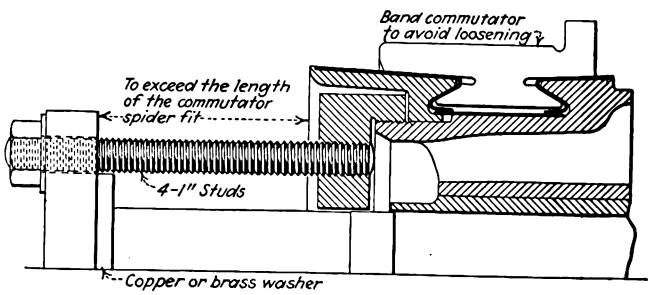
This bushing is sometimes placed inside of the flange of the V-ring, as shown in form III-B, or the flange of the V-ring may fit in the bushing, as shown in form III-A. Either construction will give the same results and is equally accessible in assembling. The bushing is omitted on low-voltage motors where dirt and moisture are not prevalent.

It has been the practice in the past to make these bushings out of mica plate. In later years micarta bushings have been found to be just as serviceable and can be supplied at a lower cost. Therefore, micarta bushings have been replacing to a large extent mica bushings on commutators used on motors up to and including 600 volts.

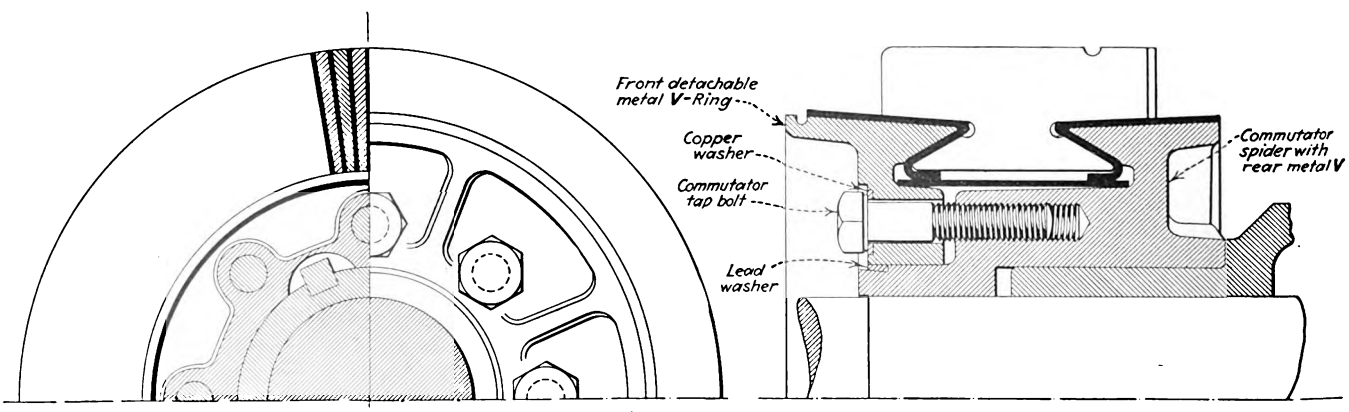
The chief consideration in the design of commutators is to keep the parts together while in service and prevent high bars. This is accomplished by the commutator bushing, which is the foundation. For small commutators the ring-nut type of bushing is used very extensively. However, in larger commutators of this type some difficulty is experienced in railway shops in obtaining a tight commutator, due to the fact that a pressure is not applied to the steel V-ring before the ring nut is drawn tight. Some believe the bolted type of commutator can be tightened without applying a pressure to the steel V-ring. This is not a good policy to follow, as the assembly will not be as tight as it should be unless pressure is applied to the V-ring after the assembly has been heated.

The bushing consists of three parts, the spider, which contains one of the metal V's; the detachable metal V-ring, and the commutator nut or bolts for holding the detachable metal V-ring under pressure. The original commutator spiders were made of cast iron. A great deal of difficulty was experienced with breakage. This difficulty was eliminated by making them of malleable iron or cast steel.

A building without a good foundation is undesirable. A commutator without an accurately machined bushing is just as undesirable. The accuracy of the machining is the most important part of any commutator, as the mechanical stresses can be taken care of by changing to metals which have higher mechanical strength. The first machining operation on the spider is the surfacing of the outside of the body. This surface must be machined to a very accurate dimension, as it is from this surface that the attached metal V's are machined and gaged. The body is measured by a snap gage. The attached metal V is then machined, after which it is



Method Recommended for Pulling Off Commutators with Ring Nut Construction



Bolted Type Commutator with Front Detachable Metal V-Ring

Two Mica V-Rings Which Were Placed in a Commutator Under Identical Conditions, Such as Same Pressure and Temperature
The light section of the ring in the illustration at the left shows squeezing of bond and the slippage of mica due to the pressure of the copper and metal V's. No slippage of mica or squeezing of the bond occurred with the ring shown at the right

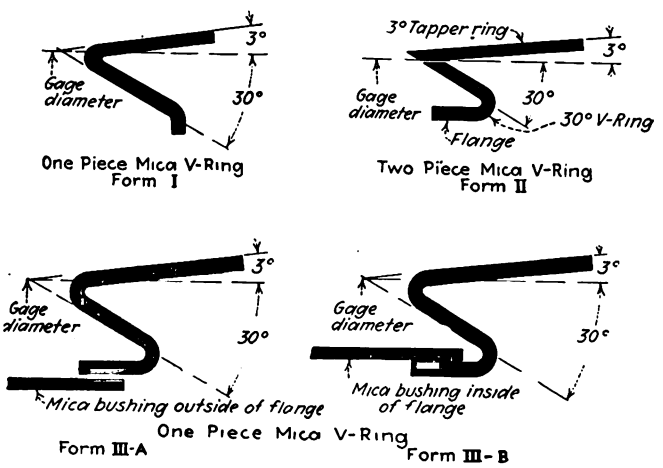
gaged by a spider gage in the following manner: The straight edge of the spider gage is laid upon the body so that the 3-deg. and 30-deg. angles of the V will fit in the V of the spider gage. The depth to which the V is bored is measured from the intersection of the extended side of the 3-deg. and 30-deg. angles of the gage to the rear of the spider by a steel scale. It is very important that the depth of this V be machined accurately, for the rear V must locate the assembled segments accurately.

On most commutators the detachable metal V-ring is the front V-ring. However, some commutators have this detachable ring at the rear. The detachable metal V-ring is gaged by a female bridge gage, which determines the accuracy with which the 3-deg. and 30-deg. faces are machined. The detachable V-ring must fit over the body of the spider with an "iron to iron" fit. It is important that it must not have any more clearance than is necessary for it to slip along the body during the assembling process of the commutator. This will prevent any movement of the detachable V-ring, thus throwing the commutator out of line. The V of the detachable V-ring is measured by a permanent female bridge gage. The ring nut type of commutator has the threads machined on the spider. They are gaged by a ring gage. It is important that the threads be accurately machined so that the ring nut will turn true on the bushing, thus giving equal pressure at all points of contact between the commutator nut and the detachable V-ring when they are assembled.

The bolted type of commutator has been very popular in the railway field, because it is easier to assemble and tighten. However, the use of the bolted construction is confined to the larger types of commutators. This is made in two designs, one with the metal V-ring detachable at the front, the other at the rear. The front ring is more common. It is held to the spider by eight or more tap bolts, equally spaced. A groove is machined in the spider to make the commutator oiltight. After assembling a lead washer is swaged in the groove to close the joint. A copper washer under the tap bolt head keeps out oil at that point.

Where it is necessary to have the large overhanging front metal V, it is a better mechanical design to cast the front metal V as part of the commutator spider. The detachable metal V-ring is at the rear of the commutator; this ring has eight or more tap lugs for the commutator tap bolts, the spider being drilled. This design, in addition to increasing the mechanical strength, lends itself more readily to an increase in the size of the ventilating ducts without increasing the diameter of the commutator.

A method used effectively for pulling the spider of the bolted type commutator from the armature spider is that of placing a steel plate with four equally spaced stud bolts against the end of the shaft, as shown in one of the illustrations on page 1090. By tightening the nuts on these bolts sufficient pressure will be exerted by the bolts to pull the commutator spider off the armature spider. This same method can be applied to the ring nut type of commutator by making a special ring nut as shown in an accompanying line cut. The four equally spaced holes are drilled and tapped in the ring nut for the pulling off bolts to be screwed into. This type of puller is very simple and can be made in any railway shop.



Cross-Section of Different Types of Mica V-Rings

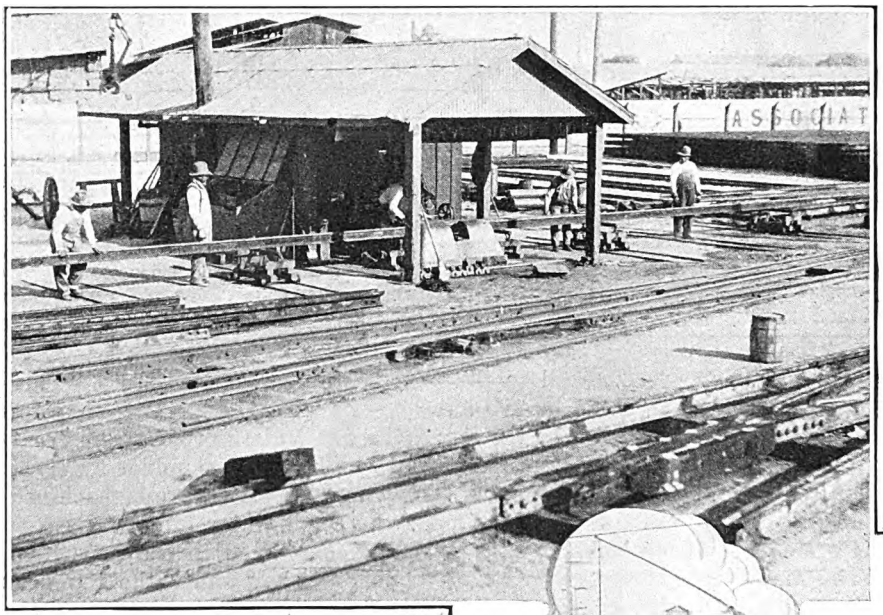
Heavy Track Built in Los Angeles

DURING the past seven years more than one-third of the track mileage of the Los Angeles Railway has been rebuilt according to an extensive program adopted immediately following the period of the war. This work has been carried on since, but not intensified as during the first three years.

Each year finds the company with better track, the new having a life of approximately twenty years built into it. The company's standard construction specification calls for 116-lb. girder rail, with continuous joints, carried on creosoted pine ties. As this property is 3-ft. 6-in. gage, 6-ft. ties are used. The track is laid on a 6-in. concrete base supported by a 6-in. sub-base of tamped and rolled crushed stone, with a 2-in. asphalt wearing surface on top. This latter construction is standard for all streets in the city.



Laying Out Rail Construction

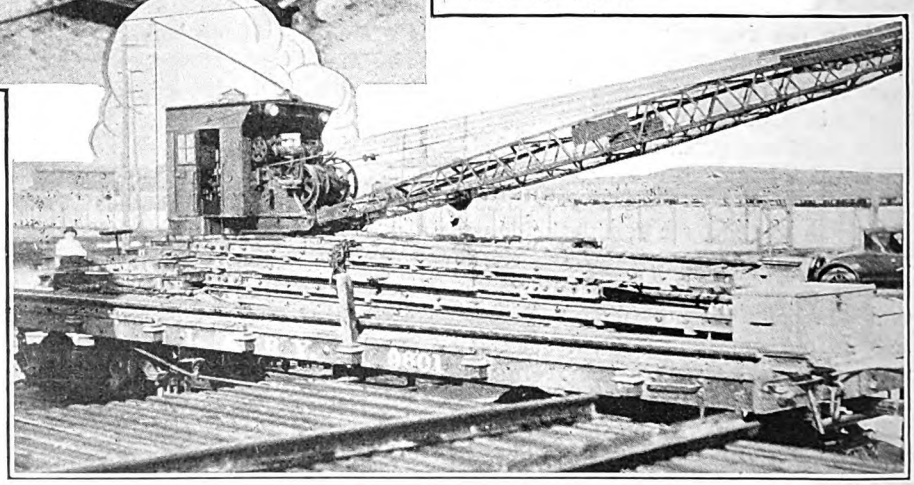
The material yard of the way and structures department of the Los Angeles Railway is used for the laying out of special work and the stocking of materials. The 350-ton hydraulic rail bender forms all curves used. A set of 100 radius boards furnish patterns for every curve used on the system.

The practice of placing rows of brick on both sides of the rail was discontinued after comparative tests were made between track so constructed and track without such protection. The need for the bricks having gone with the disappearance of steel-tired vehicles, the former construction has been adopted at a saving of approximately 5 cents per square foot.

Trackwork is carried on each year in an intensive way between April and October. Although climatic conditions in Los Angeles permit outside work during the winter months, the rainy weather which prevails during November, December, January and February hampers the outdoor gangs. In any other city this rainy weather would not be considered an obstacle to outside work. However, between April and October it seldom rains in Los Angeles and it is therefore possible for the outdoor track gangs to work every day. During this season the department places about 700 men on the work and in that way clears it all up in a very short time.

Two types of trackwork are done. One is the rebuilding of old track which has been in service for such a period as to require new rail and new roadbed. The other is reconstruction work necessary because of the change of street grades by the city. Much of this is now being done by the city in providing storm sewers. In some places a change of grade of 12 ft. has been necessary. As such work cannot be anticipated in advance, it is not included in the budget prepared by the department. However, all reconstruction of old track is prepared for in advance and carried in the budget.

Reconstruction work must be done under traffic. A short period in the early morning hours can be utilized for cutting out of certain portions of the track. However, it is impossible, due to the automobile congestion, to keep a track or portion of the street out of service during the day. In some locations, work can be done on one side while a single track movement can be maintained on the other. For this purpose portable crossovers are used. These are not only valuable for this purpose but also for the single-tracking or rerouting of cars during the rainy season when the streets become flooded.



Flat Car Provided with Cross-overs

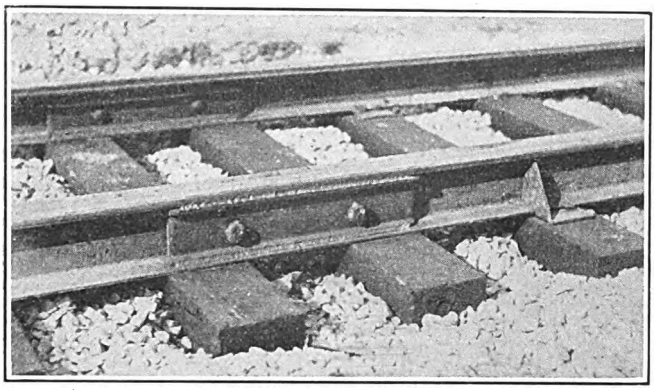
A set of portable cross-overs are kept on a flat car ready for an emergency call because of the heavy floods encountered in the rainy season.

A large yard is maintained by the way and structures department where special trackwork is laid out and rails are bent to curvatures. The company purchases its special work from trackwork manufacturers, the type used having hard centers. Curves are formed out of the 62-ft. lengths of rail with a 350-ton hydraulic rail bender. Of the 700 or 800 tons of rail stocked at the yards, approximately 250 tons is of the guard rail type to go with the 116-lb. grooved girder rail. In the construction of track no special problems are encountered because of the narrow gage.

Electric welded, continuous joints are standard. An accompanying illustration shows a typical joint with the plate welded at the head and base of the rail. One bolt in each rail is spot welded to the plate at the head-end, the nut is welded to the plate on the other side and the bolt welded to the nut. This precaution tends

Digitized by Google

to eliminate loose bolts. In lining up track preparatory to welding, advantage is taken of the difference in temperature between day and night to secure a tight joint. The open end of the rail length is blocked each night when the temperature is low. The heat of the day then expands the rail, causing the joint to close up.



Type of electrically welded continuous rail joint used in Los Angeles with the 116-lb. grooved girder rail. The plate is electrically welded at the head and base of the rail while the bolt and nut are spot welded.

This is done for several days and then the plates are welded in position.

All sub-base work is tamped with air tampers and then rolled with a 5-ton steam roller. The concreting and surface paving are let out on contract. With an asphalt surface as specified, it requires an extensive asphalt plant and all of the equipment which goes with it to do this work. The railway, not having enough of it to warrant such an investment in plant and equipment, has the work done by an outside contractor.

The Readers' Forum

More Data on Paris Type L Car

THE J. G. BRILL COMPANY

PHILADELPHIA, PA., Dec. 8, 1926.

To the Editor:

I was very much interested in reading in your issue of Oct. 23 the editorial on "Changes from Conventional Truck Design Are Attracting Increased Attention," particularly with reference to reduction of unsprung weight. You are, of course, familiar with the fact that when electricity was first used as motive power for street railway transportation the motors were mounted on the car body and much difficulty was encountered. When John A. Brill, formerly vice-president of this company, developed the first system of electric car trucks in 1887 his mounting the motors on independent trucks, instead of the body as had been attempted, was considered a very progressive step, which fact is attested to by the general adoption of this practice.

Your reference to activities in Europe interests me very much, and I have made a very careful study of the articles published in the JOURNAL on the European cars where some experimentation has been made with the shaft type of transmission. I have not only read the article in your issue of Sept. 11 on the Paris cars, but also have read the article in the May (not May 26), 1926, issue of *L'Industrie des Voies Ferrées et des Transports Automobiles* referred to in the JOURNAL article, and also the Proceedings of the Nineteenth International Congress, held in Paris June 16 to 22, 1924, which contains the details of the Paris tramways type "L" car referred to, in a report by H. Dubath, ingenieur de la Société Industrielle Suisse, Neuhausen.

In your Sept. 11 article you give the seating capacity of the Paris type "L" car as 49 passengers and the complete weight empty as 28,380 lb., while the weight per seated passenger is given as 580 lb. Reference to the above-mentioned proceedings, page 579, reveals:

"Les nouvelles motrices légères, type 'L,' de la S.T.C.R.P., tare 12.5 t., places assises 30, total des places 49, transportent elles, un poids mort de 415 kg. par place assise et 255 kg., par rapport au nombre total des places offertes."

According to our interpretation this reads that "the new light-weight motor cars for the Paris tramways, type "L," tare weight 12.5 metric tons (27,500 lb. and not 28,380 as given in your article); seating capacity 30 (instead of 49); total capacity 49; carry a dead weight of 415 kg. (913 lb.) per seated passenger and 561 lb. in relation to the total capacity."

There have been built in this country many four-wheel cars that seat more than 30 passengers and have a total carrying capacity greater than 49, the unsprung weight of which has often been several hundred pounds lighter than the 4,100 lb. given for these Paris cars, which are only light in respect to the former cars which the railway system operated. As your editorial apparently features the matter of unsprung weight I do not feel that these cars bear out your contentions and both the article and editorial lose much of their significance.

WALTER S. ADAMS,
Designing Engineer.

EDITOR'S NOTE: Mr. Adams is correct in regard to the passenger carrying capacity of the type L car of the Paris system. In the magazine article abstracted, no division was given as to seated and standing passengers. The latest information on this car is given in a paper presented at the international convention at Barcelona, Oct. 10-16, 1926, by Paul Mariage, commercial manager of the Paris system. He gives the capacity of the car, when used as the head car in a train, as 30 seated and 19 standing. When used as the second car there is room for four more standing passengers. As to total weight empty, different figures have been published from time to time, due possibly to slight changes in the methods of construction or more probably to the equipment included. The paper by Mr. Dubath at the 1924 Paris convention, quoted by Mr. Adams, gives "tare" weight 12.5 metric tons, or practically 27,500 lb. The magazine article abstracted in the JOURNAL gives for the latest type at that time 12,900 kg. or 28,380 lb. This was the figure published. Mr. Mariage's 1926 report, mentioned above and just received, gives 12,800 kg., or approximately 28,160 lb., as the total weight, empty, with complete tool equipment, full sand boxes and windows in place. According to American standards most continental European cars are not particularly light per seat or per passenger carried, due to two causes. One is that many cars are narrow so that only three instead of four passengers can be seated across the car on cross seats. This is true in all Paris surface cars. The other is that the number of standing passengers is limited. Thus, in the car in question, no passengers are allowed to stand in the aisles, but only on the end platforms and in the center well. The point made in the editorial was that changes from conventional practice in the direction of the European experiments mentioned may offer the opportunity of reducing upsprung weight. The editorial also commended the value of this research work being carried on in Europe. The entire art of gear and transmission design and manufacture has made long strides since the early days of body mounted motors mentioned by Mr. Adams.

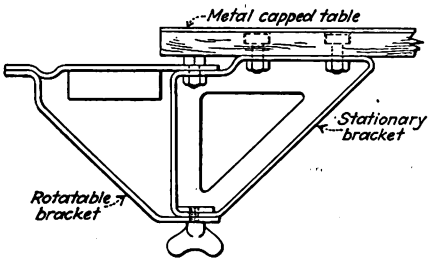
Maintenance Notes

Disappearing Armature Winding Stand

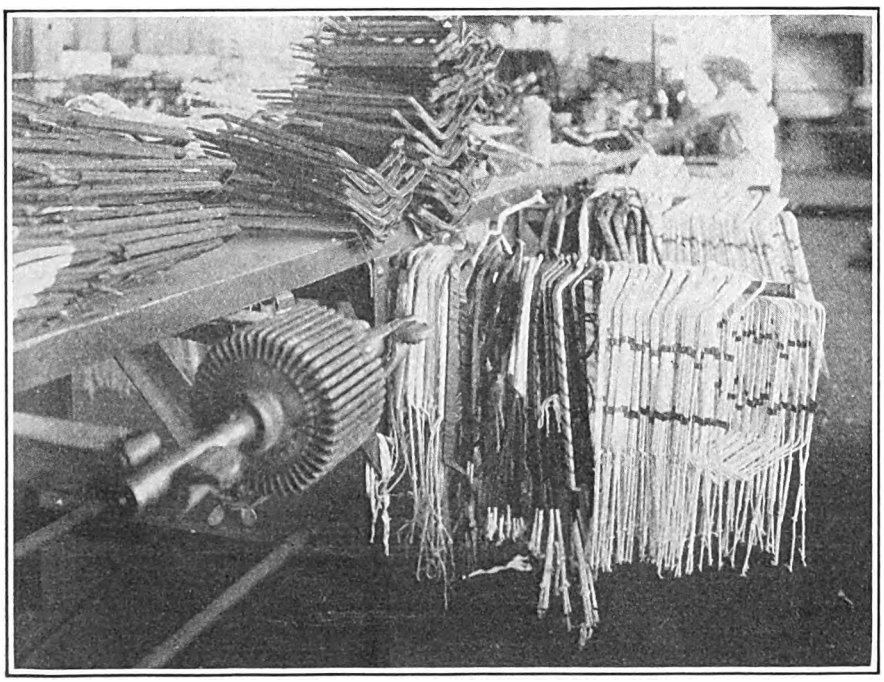
THE accompanying illustrations show a disappearing type of armature winding stand used while rewinding the smaller sizes of armatures such as are used in compressor motors in the department of electrical repairs of the Brooklyn-Manhattan Transit Corporation. The support consists of two hinged



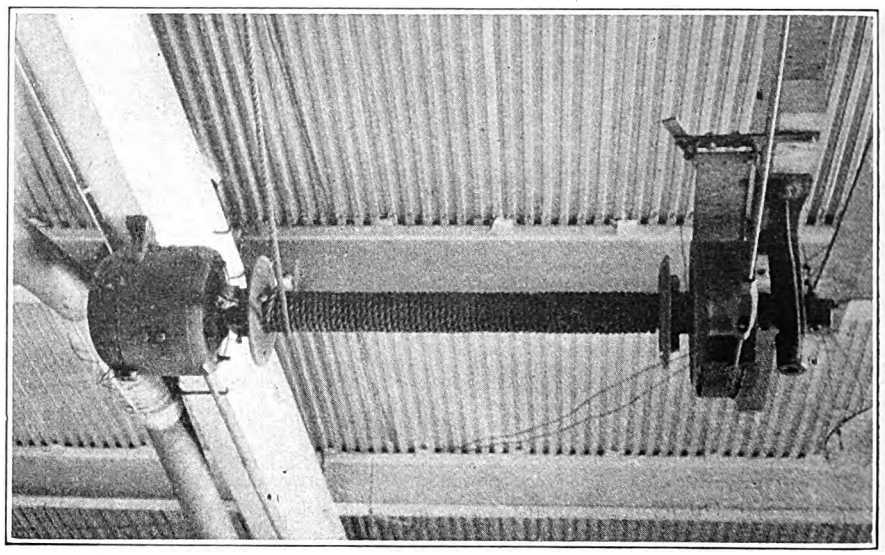
Construction of Disappearing Armature Winding Brackets

brackets which can be swung under the bench when not in use. In the illustration showing the construction only one bracket is shown. In case the armature shaft should be too short to span the distance between the supports small lengths of pipe are used to increase the effective length of the shaft. These are slipped over the ends of the original armature shaft.

In the construction used a stationary bracket is bolted to the underside of the winding bench. The bracket which supports the armature is hinged at the top and bottom of the stationary support so that it rotates readily and can be swung out of way or adjusted to convenient positions.



Armature in Position for Rewinding Supported by Two Disappearing Brackets at the Winding Bench



Motor-Operated Hoist Ready for Service

Air Compressor Motor Used for Lumber Hoist

HANDLING of light incoming lumber from the ground floor of the shop to the storage space located in the balcony of the Jamestown Street Railway shop in Jamestown, N. Y., is done by a motor-operated hoist installed in the balcony. Certain parts needed for the hoist construction were on hand, and as the cost of assembling these parts was much less than a manufactured product, K. L. Connor, master mechanic, decided to build the hoist in the shop. Material used included an Allis-Chalmers air compressor motor, a 5-ft. x 1½-in. shaft, a 12-in. pulley with a 6-in. base, a standard line shaft bearing and a 6-in. leather brake.

The armature of the Allis-Chalmers air compressor motor was pressed onto the end of a 1½-in. round shaft about 5 ft. long. A 12-in. pulley with a 6-in. face was keyed securely to the shaft 1 ft. from the other end. The assembled unit was installed and lined up on the ceiling of the gallery. The extended armature shaft with auxiliary parts is supported at one end by the

"Rattles and bumps" will accelerate your cars over the dumps.

Digitized by Google

motor end bell bearing and at the other by the line shaft bearing.

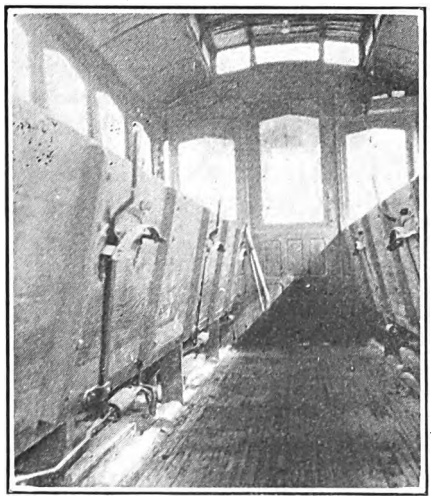
One end of the 6-in. x ¼-in. leather belt is wrapped around the pulley and the other end is connected to a ⅝-in. iron rod which is fastened to one end of a fulcrum casting about 6 ft. away. The fulcrum casting is connected to an adjustable hand rod which permits most any desired leverage with corresponding friction upon the pulley to be obtained. With this arrangement the load can be held or dropped as desired.

The speed of the motor is controlled by varying the resistance in the armature circuit. Direction of rotation is regulated by field reversing switches conveniently located. This hoist is doing most satisfactorily the work for which it was designed and its use has resulted in speeding up the lumber handling.

Systematic Oiling "Safetyfies"
Thus reduce your "S.O.S." cries.

Sand Car with Six Hopper Outlets

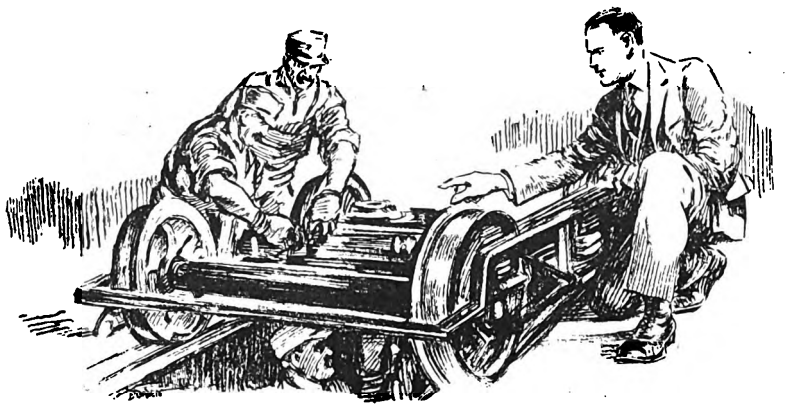
SIMPLIFICATION of rail sanding methods and continuity of sand flow have been considered of such great importance by the York Railways, York, Pa., that a special sanding equipment was designed and constructed. A single-truck passenger car, having served its usefulness, was stripped of all internal fittings. Two large sand bins were constructed along either side throughout the entire length. Each bin can accommodate 5 cu.yd. of sand when filled to capacity and is made of



Sand Bin and Hopper Operating Levers

Dick Prescott Inspects an Overhaul

and Sees a Wood Block



STEVE WHITE, carpenter shop foreman, was worried about the mutterings that he had heard among the men in the Consolidated Railway & Light Company's shop. He lost no time in voicing his uneasiness to Dick Prescott, young assistant superintendent, for whom he had developed a deep regard and friendship.

But Dick was not disposed to take the subject seriously. He felt that it was entirely natural for some of the men to question the wisdom of his appointment, after so brief an experience, and almost dismissed the subject from his mind on leaving the little carpenter shop office. Steve, however, continued to feel grave concern for his friend Dick.

Absorbed in the job of improving maintenance practice, Dick went on out to the overhaul shop, where one of the largest group of cars on the property was being put through as rapidly as the cars could be taken out of service. Several gangs of men were at work on this job and Dick stopped near one of the trucks to look over the work.

"How do you find them, Joe, in pretty bad shape?" queried Dick, addressing the workman in charge of the gang.

"You bet, bad," grunted Joe. "Big job to fix 'em."

"Guess you're right, Joe. They went too long without any real attention and now they're pretty well shot, eh?"

"Yeh," again grunted Joe in assent.

"How fast are you fellows going to get them through the shop?"

"Slow work," said Joe. "Too unhandy here to get much done. Have to fool around lot. Only two tracks here. Cars in way. Too much time jacking up and down. Lose lot's time. Cost lot's money."

"Yes," agreed Dick, "I can see that, all right. You have to get the cars on this track all up on horses to get the trucks out. Then the men on body work back there have to do a lot of climbing up and down to get in the cars. We need a car hoist or crane here pretty bad."

"Need it bad," repeated Joe.

Dick continued to watch Joe and his men as they proceeded systematically with their work of dismantling the truck. He noted that the gears were badly worn and that they showed evidence of lack of proper lubrication.

"Do you find many of the gears in bad shape like that?" he asked.

"Yeh, lot's of 'em. Gear cases all shot and some trucks no cases at all."

"That's a nice mess," said Dick. "What's the matter with them? Don't we have enough gear cases to go around?"

"Knock 'em all off," was Joe's comment. "Track on Main Street in hell of a shape. Paving all shot and busts gear cases every day."

"Well, that's going to be different soon, Joe. They're working on the Main Street track now and it will be in first-class shape in a few weeks. That means we've got to go after these trucks right now that we've got a chance to do so. Are there plenty of gear cases in stock?"

"Yep," replied Joe.

"All right. Make sure every truck is fully equipped when it leaves here, with plenty of grease on the gears. Then I'm going to get after the carhouses to make sure they keep them that way."

At this point one of the men unbolted the center bearing and removed it from the bolster.

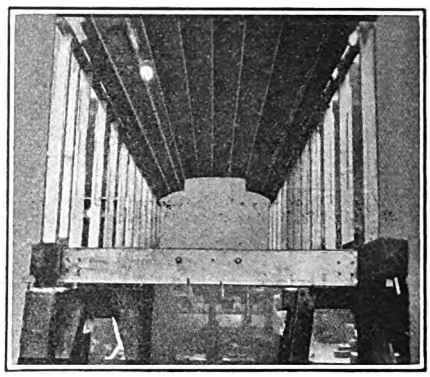
"What do they have that wood block under the bearing for?" asked Dick, suddenly interested.

Digitized by Google

heavy yellow pine planking reinforced by substantial oak timbers.

Three Brill sand hoppers are a part of each bin, having exits in front of and between the wheels directly over each rail. Operation is by individual hand levers installed on the front of the bin and held in a latched position by a notched circle plate. This is mounted directly in front, thus permitting any desired degree of sand flow. The operating handle normally is held in the off position by a heavy coil spring attached to the lower extremity of the lever. This multiplicity of sanding outlets has eliminated the constant shoveling of sand into the hoppers, decreased the possibility of failure and has permitted the operator carefully to observe the results obtained by the sanding equipment.

You may forget your dignity, but don't lose your "bearings." Watch your babbitting.



Underframing of One-Man Cars Being Converted in Shop at Scranton

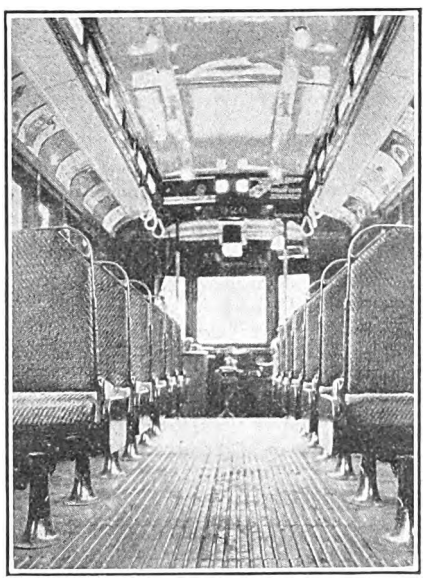
84½ Per Cent One-Man Operation Reached in Scranton

ONE hundred per cent one-man operation is the aim of the Scranton Railway, Scranton, Pa. When the ten two-man cars now being rebuilt in this company's shop are completed for one-man operation 84½ per cent one-man operation will have been attained. Two of these have been completed and the remaining eight are well under way. Such parts of the old body and equipment have been used as were found suitable for further service and which would conform to the design adopted.

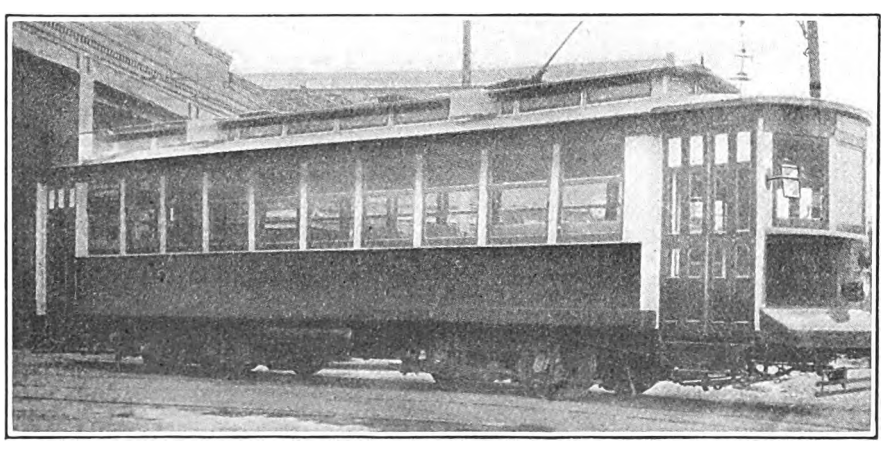
For economical reasons new framing was constructed with side and end sills of long-leaf yellow pine reinforced by well-seasoned oak cross framing. The sills employed are somewhat heavier than are ordinarily used on cars of this type and weight, being of 7⅞-in. x 9-in. and 5½-in. x 10-in. material respectively. Siding consists of ⅛-in. steel plates securely screwed to the posts. Rattan seats removed from the old cars were utilized. They consist of twelve cross and four longitudinal seats to provide for 45 passengers.

Old equipment of GE-80 motors with K-28 control and straight air brakes was completely overhauled and reinstalled. New safety devices of the National Pneumatic Company were adopted. An added safety feature is that of an adjustable observation mirror installed on the vestibule post which permits the motorman to obtain a clear view of the rear step of the car under all conditions.

The coloring of the outside of the car is orange with cream trimming and the inside is white veneer with cherry trimming. These color combinations give a very pleasing effect.



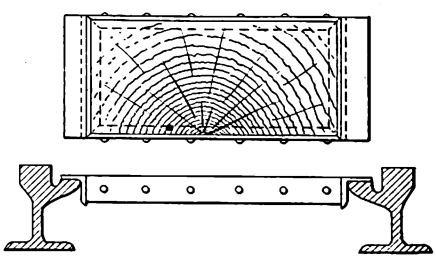
Interior View of One-Man Car Showing Motorman's Unobstructed View



Completed One-Man Car with Motorman's Observation Mirror

Carhouse Pit Planks Reduce Accidents

OPEN car pits or insecure pit planks are always a source of serious danger to the men working in and about a shop. This has been eliminated to a great extent in the shop of the Harrisburg Railways, Harrisburg, Pa., by the adoption of a rigid non-shifting pit plank, designed by the company.



Protected by a Frame of Angles the Pit Plank Fits Accurately Between Rails

This plank consists of a piece of 1-in. x 14-in. oak securely incased in a frame of 1-in. angles. Pieces of 1¼-in. angle are welded to the backs of the angles at the ends, with the top flush with the top surface of the plank. The over-all dimensions of the plank with its framing are just sufficient to permit it to drop between the rails without any lateral motion and the length over the supporting angles allows for wheel flange clearance. This plank affords a ready means for the men to pass across a pit. There is no necessity to raise it to permit of truck passage as is the case when planks are laid

Digitized by Google

on top of the rail. Again, danger of breakage and slippage is minimized, as no lateral motion is possible and flange clearance is provided. Since these planks have been in service pit accidents have been reduced greatly.

Refuse Receptacle for Car Floor Sweepings

MAINTAINING a clean appearance of the shop floor of the Valley Railways, Lemoyne, Pa., is given constant attention by the organization. Suitable containers placed in convenient locations throughout the shop for the reception of refuse material, together with a receptacle to receive car floor sweepings, assist greatly in this.

Receptacle in Position to Receive Car Floor Sweepings

This receptacle is made of No. 16 gage galvanized iron having a base dimension of 8 in. x 15 in. and a sloping top. The maximum height is about 18 in. and the minimum such as to permit of sliding under the platform flooring, while the container rests on the car step. Suitable handles are provided for carrying.

Placing the receptacle on the car step for the reception of the floor sweepings not only eliminates double handling of the refuse but keeps it from being scattered over the shop floor, from where it would be tracked still further by the workmen.

The electric railway and your car journals
Both deserve careful thought as to their internals.

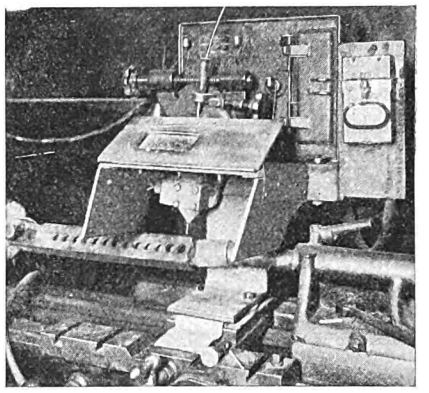
New Equipment Available

Automatic Welding Insures Better Workmanship

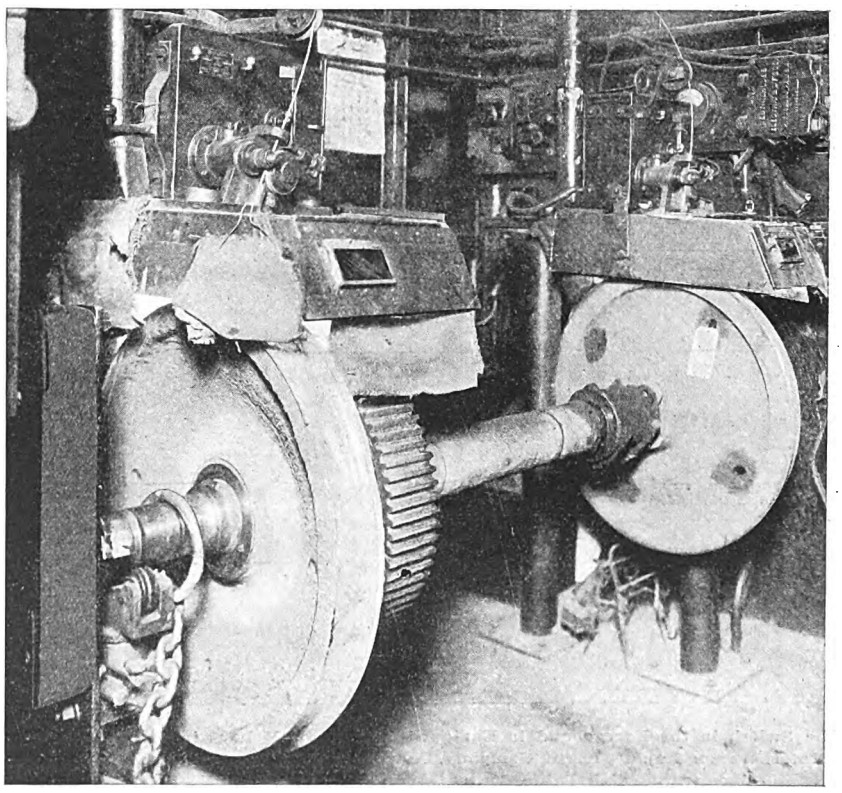
INCREASED use of automatic arc welding is being made in electric railway repair shops because the welds produced are reliable and the human element in welding is decreased. To meet the needs for an automatic welding machine, the Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa., has brought out the Auto-Arc.

A large field of usefulness for the new automatic machine, it is stated, is for welding and building up of worn surfaces, such as those on brake equalizers, and other brake rigging parts. For this purpose the Auto-Arc is mounted on the carriage of a lathe so that it can be moved along the work either by hand or by the lead screw, with an adjustable driving speed. The brake equalizer or other part is placed on the lathe and the sides are held in position temporarily by a clamping device. The operator starts the machine, and with the work remaining stationary the welding is performed as the Auto-Arc moves along and deposits a seam of metal.

Another use for which the new welding machine is adapted is that of building up worn flanges of steel wheels used in city service. The worn wheel is placed in a device that consists of two stationary pedestals on which the car wheels are free to rotate. The wheels are driven by an attachment to the axle through a reduction gear, which in turn is driven by a small motor. The Auto-Arcs are mounted on a stationary pedestal and are free to swing as desired by the operator. As the wheels revolve



Equalizer Bar in Place on Lathe with Auto-Arc Ready to Start Welding Operation



Worn Car Wheels in Position for Welding Automatically

Digitized by Google

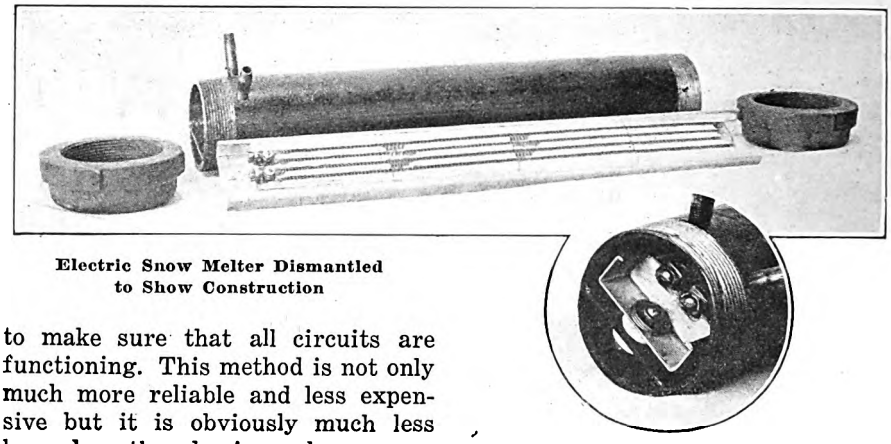
the Auto-Arcs deposit the metal at a peripheral speed of about 10 to 12 in. per minute. A set of car wheel flanges can thus be built up in approximately 2½ hours.

Electric Snow Melter for Track Switches

BY JOHN M. BOND
Transportation Division, Westinghouse Electric & Manufacturing Company, New York, N. Y.

KEEPING track switches open and operative during snowstorms can be accomplished best by keeping the points and mechanism above a freezing temperature. For this purpose the Westinghouse Electric & Manufacturing Company has brought out an electric snow melter. This was developed for and is now used extensively by the Interborough Rapid Transit Company, New York. The switches on the Interborough are of the automatic type, controlled from towers. During severe snowstorms they are liable to give trouble due to freezing or clogging with snow unless they are kept clear. The method used in the past was by shoveling and sweeping, but this requires a large force of men and equipment which must be held available for such emergencies during the winter months, and consequently is very costly and none too satisfactory.

The snow melters eliminate this manual work by giving off sufficient heat to melt the snow as soon as it reaches the ground and also to keep the switch movement from freezing. The number of men needed is reduced to a minimum of perhaps one or two, their only duty being to see that the current is properly turned on when the snowstorm begins and to inspect the switches occasionally to make sure that all circuits are functioning. This method is not only much more reliable and less expensive but it is obviously much less hazardous than having a large number of men shoveling and sweeping out switches during a blinding snowstorm within a foot or two of a live 600-volt contact rail.



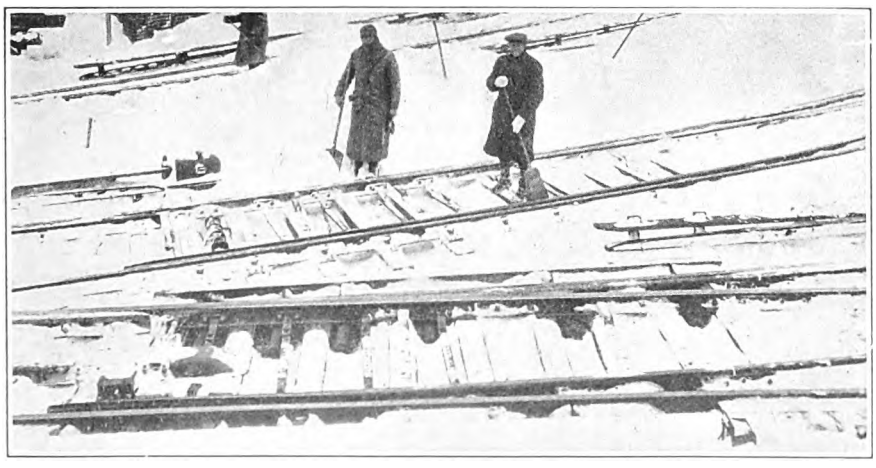
Electric Snow Melter Dismantled to Show Construction

The snow melters are designed to withstand extremely rough handling, such as being struck with picks and shovels. The heater element is made up of two coils, about ¼ in. in diameter, of nickel-chromium wire connected in parallel and supported in four grooved porcelain blocks which are held firmly in a sheet steel trough running lengthwise through a standard 3½-in. black steel pipe, 2 ft. long. The trough is sherardized to prevent rusting and is attached by insulated bolts to cross bars which are welded inside the pipe at each end.

Both terminals are at the same end of the pipe. Two standard pipe nipples located just above the terminals provide entrances for the connecting wires, which are sealed with tape and compound into the nipples, both outer and inner edges of which are beveled to prevent damage to the insulation of the wires. The ends of the pipe are equipped with standard light-weight pipe caps, red leaded to make the units watertight. By removing the end cap nearest the nipples the two terminals are exposed and are easily accessible for the purpose of connecting the units during installation. A steel terminal clip welded to the outside of the pipe provides a means for grounding the case of the unit.

The units supplied to the Interborough Rapid Transit Company were designed to operate twelve in series on a 650-volt, d.c. circuit, this being the number of units used at a switch. Connected in this manner each unit consumes 1,200 watts or a total of 14,400 watts per switch. Since the power used by the snow melters is proportional to the square of the applied voltage, the heat given off will, of course, vary accordingly. The current is taken from the contact rail through a fuse and a single-pole, single-throw knife switch directly to the units, each track switch equipment being supplied with its own knife switch and fuse so that it can be controlled independently of the others. Six units are placed under each switch point, the switches on this property being of the double blade type. In certain cases, however, depending on the curvature of the switch, the number of heaters used may vary from twelve to twenty. Also one heater is placed under the switch movement.

The heaters are laid horizontally on the roadbed between approximately alternate pairs of ties and parallel with them, beginning at a point just ahead of the switch blade and proceeding back toward the heel of the switch. All cases are grounded to a common wire. They are located not less than 1 to 2 in. below the bottom surface of the track as a precaution against interference with the automatic signal circuits if the casings of the units should come in contact with the rails.



The Switch in the Foreground Is Equipped with Snow Melters in 148th Street Yard of Interborough Rapid Transit Company, New York City, During Severere Snowstorm. The Rear Switch Being Swept Out by Workmen Has No Snow Melters

Snow Fighting in New England

Symposium Presented at Recent Meeting of the New England Street Railway Club Considers Methods of Keeping the Lines Open in Bad Weather so as to Increase Passenger Riding

DISCUSSION at the last meeting of the New England Street Railway Club, held in Boston on Dec. 2, was devoted largely to the subject of snow fighting. This was mentioned only briefly in last week's issue. In introducing the subject President F. D. Gordon emphasized the change in attitude of street railway men. Formerly they were satisfied to obtain sufficient revenue in the summer months to carry the road through the year. Nowadays, when rail transportation furnishes greater convenience than automobile transportation in the winter, January, February and March are the best revenue producers, and attention must be given to keeping the tracks open and the cars as nearly on schedule as possible. Four papers on this subject, by Messrs. Scott, Flanders, Bolt and Lockman, are abstracted elsewhere in this issue.

In the discussion Mr. Scott stated that crews make particular note of any excavations or unfinished street work prior to snow storms. Any obstructions that might interfere with the snow plows or wings are given particular attention. He also believes that an ordinance should be passed prohibiting automobile parking along the curb for 24 hours succeeding a snow storm. This would permit the city and company to clean up the streets quickly and would not only help the schedules but would help the public.

Both sweepers and plows are used by the Connecticut Company, according to Mr. Scott. Sweepers are not as satisfactory now as before the automobiles were on the streets. With the temperature low and starting with the beginning of a storm the sweepers will do good work. They are also used in the heat of the day after the snow is loosened up.

Low spots and grooved rails are salted, depending on storm conditions, while the track is salted right along. In a heavy storm with the temperature dropping the amount of salt used is greatest. The coarse grade of salt is used. Salt is distributed in 100-lb. bags in Providence and in 56-lb. bags in Connecticut. In 56-lb. bags it costs $15.71 a ton, in 100-lb. bags $13.80 a ton and in bulk some $5 or $6 a ton cheaper. The reason given for favoring the use of smaller bags than 200 lb. is the greater ease of handling.

In the absence of Mr. Flanders, his paper was read by H. J. Sullivan, superintendent of line and track Springfield Street Railway. Mr. Sullivan stated that better results are obtained in Springfield with sweepers than with plows. Rattan and steel mixed are used in the brooms. Canvas guards are used with the sweepers, to prevent breakage of windows or injury to pedestrians. Ice cutters with teeth are used to advantage. In Springfield the city assists with traction snow plows by pushing the snow directly over to the gutters, thus keeping the street clean. This year the city will have 38 trucks and seven tractors for the work. On some streets the city does all the cleaning while on others the railway handles it. The snow is dumped into the Connecticut River.

In Springfield several drivers of coal trucks have been arrested for stopping their vehicles on the car tracks and obstructing the street. When the snow loaders are started out they are accompanied by police officers, who move all automobiles out of the way so that the snow can be loaded.

On the Eastern Massachusetts Street Railway, according to Mr. Bolt, the single-truck snow plows are not a very important factor. During wet snow storms the service should alternate with a plow trip following two or three round trips of sweepers.

Buses that are equipped with scrapers can be operated in 3 to 4 in. of snow. After it gets deeper than that the scrapers are lifted and the roadway must be plowed with caterpillars or trucks.

The levelers of this company weigh about 1½ or 2 tons each, and are put on or taken off with the aid of crane cars. They are adjusted to the angle desired and then held in place by means of chains.

The Cumberland County Light & Power Company has also used levelers or wings on its plows. These are about 18 ft. long, according to G. C. Haggas, chief engineer. The use of the levelers has provided a place for automobiles away from the car track.

A rotary ice cutter developed by the Eastern Massachusetts several years ago was described by Mr. Glynn of that company. This machine cut so much ice that a platform was built out in front. After that an equipment was designed having a conveyor with 5-ft. blades. Not enough men could be put in the small space to shovel the snow off. Then a snow plow was designed built of steel and having solid steel blades raised or lowered by hydraulic jacks. A cross conveyor was put on. The plow was able to take off 1 in. of solid ice with a layer of 3½ ft. of snow for a distance of ½ mile in an hour and a half. The machine does not compress the snow, but lifts it.

COMING MEETINGS OF *Electric Railway and Allied Associations*

Jan. 6-7—Midwest Electric Railway Association, midwinter meeting, Mayo Hotel, Tulsa, Okla.

Jan. 7—American Electric Railway Association, Metropolitan Section, Engineering Societies Building, New York City, 8 p.m.

Jan. 10-14—American Road Builders' Association, convention and road show, Coliseum, Chicago, Ill.

Jan. 18-19—Kentucky Association of Public Utilities, annual convention, Brown Hotel, Louisville, Ky.

Jan. 19-20—Central Electric Traffic Association, Fort Wayne, Ind.

Jan. 21-22—Central Electric Railway Accountants' Association, Fort Wayne, Ind.

Jan. 25—New York Electric Railway Association, winter meeting. Hotel Commodore, New York City.

Jan. 26-28—Association of Equipment Men—Southern Properties—Memphis, Tenn.

Feb. 3-4—Central Electric Railway Association, winter meeting, Toledo, O., Commodore Perry Hotel.

Feb. 7-10—American Institute of Electrical Engineers, annual convention, Engineering Societies Building, New York City.

Feb. 10—Central Electric Railway Master Mechanics' Association, Toledo, Ohio.

Oct. 3-7, 1927—American Electric Railway Association, annual convention, Public Auditorium, Cleveland, Ohio.

Fighting Snow in Springfield and Worcester

BY H. M. FLANDERS
General Manager Springfield Street Railway, Springfield, Mass.

SPRINGFIELD and Worcester have street railway properties with similar physical characteristics. The total track mileage of the Springfield company is 203 and of the Worcester company 292. About half the mileage of each company is in center location in city streets, the other half being suburban lines, mostly of side location. Each company operates about 7,000,000 car-miles per year.

Snow-fighting organization and methods are practically identical on each property and are in charge of division superintendents. The transportation department is responsible for manning plows and sweepers, assigning

Digitized by Google

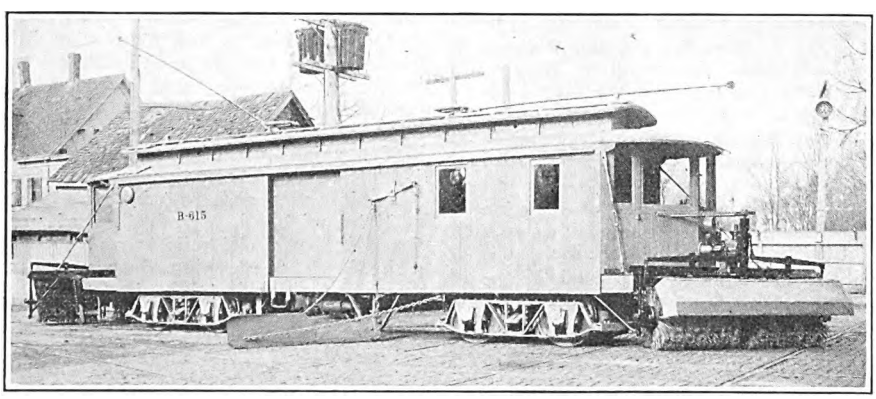
them to the lines and for keeping the lines open. The track department is responsible for the removal of all snow from streets where necessary and for keeping switches, yards, ditches and drains clear.

Each fall the division superintendents assign crews to certain lines. Each of the plows and sweepers sent out is manned by two or three uniform men, the third being a uniform man taken from the spare list.

The plows and sweepers so manned are sent out to the assigned lines as soon as the superintendents deem it to be necessary, a record being made on a sheet similar to a train dispatcher's sheet. Each crew has instructions to telephone the superintendent as often as practicable, posting him on conditions, and this information, with any special orders, is all recorded on the snow-dispatching sheet. All street inspectors report to the superintendent. Certain men are assigned to fixed strategic points, the remainder going to various points as required to act as the superintendent's representative on the job. The superintendent of tracks has authority to employ as many extra men and trucks as are necessary for his snow removal work.

As soon as the storm starts, the mechanical department assigns men to care for snow-fighting equipment. These men are on duty until the storm ends and attend to oiling, greasing and repairing as needed.

Springfield and Worcester each has one double truck rotary plow. These are rarely used; in fact, only in cases of extreme drifts. Springfield has four double-truck nose plows and five double-truck shear plows; Worcester ten double-truck nose plows and seven double-truck shear. Springfield also has nine single-truck shears and three single-truck nose plows, while Worcester has three single-truck shears and two single-truck nose plows. Except in light snows, the single-truck plows are practically worthless unless operated with a pusher.



Eastern Massachusetts Sweeper Equipped with Leveler

Springfield has two single-truck sweepers and nine double-truck sweepers. The former are used principally to keep our open air storage yard clear. Double-truck sweepers are used on the line. Worcester has thirteen double-truck sweepers. In both cities the double-truck sweepers are more efficient in practically any kind of a storm than are the double-truck plows. We have no figures of value as to comparative operating of maintenance cost of plows and sweepers. We believe that the sweepers can be operated and maintained at a much lower cost than the plows. Practically no cars in Springfield or Worcester are equipped with snow scrapers.

The only special equipment on either property consists of snow loaders and automotive trucks equipped with plows, each property having one Barber-Greene snow loader. The loaders are very efficient and economical and we have averaged in an eight-hour day a 5-ton truck loaded every three minutes. We have not used the trucks equipped with plows for plowing the tracks, but simply for throwing the ridges left by the plows and sweepers back into the gutters, where the snow can be handled by the snow loader.

We use salt in switches, and on practically all hills having grooved rail, catch basins and drains salting is begun as soon as the snow begins to fall.

The consumption of salt per mile of track per season for the last three winters was from 1,309 to 2,945 lb. per track-mile in Springfield and from 1,917 to 2,772 lb. per track-mile in Worcester.

Experience in Snow Fighting on the Eastern Massachusetts

BY W. C. BOLT
Superintendent Rolling Stock and Shops Eastern Massachusetts Street Railway
Chelsea, Mass.

EACH one of our thirteen division managers is fully responsible for transportation in his respective districts, including efficient and economical snow fighting. At the beginning of a storm, all sub-department heads are notified and requested to report immediately to the executive in charge, either the division manager or his division superintendent. It is our general plan to start fighting snow as soon as it is possible to man plow equipment. Delay in this respect has been found to be costly, and we very much prefer to operate our snow-fighting equipment early.

All paved track is covered first by sweepers. It is occasionally possible to cover all lines with sweepers and passenger car scrapers without using the heavier snow plows. Should the weather reports indicate a heavy snowfall, heavy plows are likewise placed in service without delay.

At the central headquarters, an accurate log is kept on which is recorded for each route the number of the plows, the time each plow started and the time it returned. It is generally planned to determine the exact location of every plow at least every 30 minutes. Plow crews have instructions to call headquarters by telephone if any unusual delay occurs. An automobile or taxicab is used in event a plow crew has not reported within a reasonable time.

After each storm, a report is prepared by each division manager, one copy of which is forwarded to the vice-president in charge of transportation, and one copy to the superintendent of rolling stock. This shows the hours and miles operated by each unit of snow-fighting equipment, the equipment failures, if any, the approximate inches of snowfall, the time storm began, the time storm ended, lines blocked and serious interferences with service, and an estimate of the total cost.

KINDS OF EQUIPMENT USED

We have a total of 88 double-track electric snow-fighting units to cover the 635 miles of paved and unpaved track, or an average of 7.2 track-miles per double-track unit. Electric snow sweepers have been found by us to be very efficient and particularly effective in snow storms with temperature under 29 or 30 deg. Sweepers are able to operate on paved track at relatively high speed, to clean thoroughly the street between tracks, and aid considerably in preventing the building up later of so-called "high centers." Sweepers, however, become less effective under heavy wet snow conditions, and it is then necessary to resort to plows. In unpaved track, of course, snow plows are very much more effective than sweepers.

The 23 passenger cars which have been equipped with Root scrapers have performed very satisfactorily. This type of unit replaces a regular passenger car, and at the same time clears the track zone of snow. It can cover more miles of track with one man than any other type of equipment, and is particularly effective in snowfall with temperature under 30. deg.

Our records do not give us information as to the relative cost of operating the several types of equipment. As between plows and sweepers, sweepers perhaps are slightly more expensive to maintain. However, we do not feel that this is an important item.

All of our snow-fighting units with the exception of Root scrapers, are equipped with levelers, and these are used to the maximum extent possible. In heavy, congested traffic, of course, the use of levelers would retard service. It is, however, important to level snow back from the rails as much as possible in order that automobile traffic will not find it necessary to use the tracks and

Digitized by Google

thereby seriously delay passenger service.

Five of our heavy double-truck work cars have been equipped with steel levelers, 12 ft. long and 3 ft. wide. These equipments have been found most efficient for leveling purposes, and are used almost exclusively at night after each storm.

We also have an electric equipment known as the Sampson Axcess Ice Cutter, which has been effective under certain conditions, particularly where lines have been completely snowed-in. This unit carries a cutting blade, a rotating picker, a main conveyor and a cross conveyor.

Relative Advantages of Rail and Mobile Equipment

We have a rather large complement of equipment which is gasoline driven and not confined to rails, comprising: Seventeen Root scraper attachments for buses; fourteen Good Roads Machinery shear plow attachments for trucks; seven 5-ton Best caterpillar tractors for one-man operation equipped with Sargent steel-nose plows; one 7½-ton Walter tractor equipped with Good Roads Machinery shear plow and Walter center scraper. This equipment is intended primarily to care for the 116 miles of bus lines operated. The seven 5-ton caterpillar tractors have just been purchased, and it is our intention to use these tractors in conjunction with our electric snow-fighting equipment.

There is no question but what gasoline-driven equipment is of considerable advantage in temporarily taking care of a route which may be blocked by a stalled truck or otherwise. Traffic centers and street intersections can best be cleared of snow with gasoline-driven equipment.

Our average annual consumption of salt is approximately 475 tons, or three-quarters of a ton of salt per mile of track. Each plow is equipped with a number of barrels of mixed sand and salt. This mixture is used particularly on grades where iced condition of rail has made traction difficult. A mixture of sand and salt frequently seems to do better work in cutting ice than pure salt.

Cost of Fighting Snow

Our expenditure for fighting snow as recorded in Account No. 12, and expenditures for cost of maintaining snow fighting equipment, Accounts No. 32 and No. 33D, have averaged $198,499 per year for the last six years.

The total annual cost including fixed charges, based upon the average cost of the last six years, is $295,500, equivalent to the revenue from 4,220,000 passengers. Our average annual expenditures for fighting snow including fixed charges would pay 58 per cent of our common stock dividend. Again it would pay our entire annual dividends on the first preferred stock. Twenty-five per cent of our total bond interest could be taken care of if we were not confronted with snow-fighting expenditures. All of these figures refer to the cost of fighting snow with electric plows, and do not include any costs in connection with plowing snow on our bus routes.

Snow Removal in Hartford

By N. J. Scott
Manager Hartford Division the Connecticut Company

RAILWAY operators disagree as to the benefits of snow, and the only real answer to the question is our net revenue. We all agree that our gross is much greater in winter and at times of heavy snow, and if we can help one another to work out economical snow-fighting operation and removal costs it will be to our mutual advantage. The following is the procedure at Hartford, Conn., which has a population of 170,000 and a trading population of at least 250,000. The track mileage is 173.38.

When the storm begins a starter reports at the carhouse where snow-fighting equipment is housed and immediately thereafter crews report to him. Previously all snow-fighting equipment has been put in shape and loaded with salt. Each crew is given a route card and, barring sickness or some unavoidable occurrence, crews are assigned to the same routes and same equipment on each storm. The routes are so arranged as to get the most out of the equipment and the least possible time is lost in changing ends. This practice also improves passenger car schedules.

Starting with the storm again, two dispatchers divide up the lines by telephone circuits and control the movement of the snow-fighting equipment under the direction of the superintendent. Progress and difficulties are recorded at all times. Principals operating the equipment are well qualified for their work and keenly feel the responsibility of keeping their routes open. The crew starter provides reliefs and lunches for the crews as required. We have four double-truck sweepers and two single-truckers. These are used effectively on city routes with improved pavement in handling light snow and in cleaning up after plows. They are also useful in the work of the day following storms in cleaning tracks subjected to the vehicular traffic. Shear plows are used on city and on some suburban lines and are exceptionally good on double-truck operations. The A plows are used on single-track suburban lines, but the side shear plows seem to give better service. We move the snow with the wings and leveling boards as far from the rail as possible, where it is picked up by either truck or tractor and removed further from the rail or to the gutter side. This leaves a good traveled highway, which helps us in subsequent storms and maintenance of schedules, as all vehicular traffic is not forced to the car track.

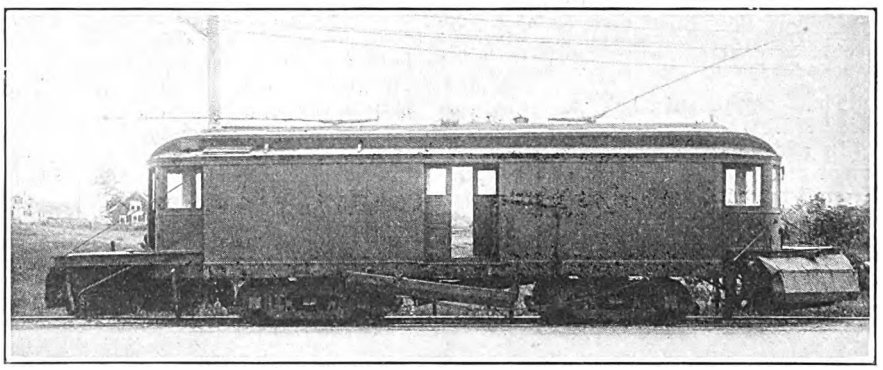
All cars are equipped with snow scrapers and are used to advantage not only at the time of storm but following the storms when vehicular traffic drags so much snow onto the rail and also in cases of slight drifting.

All of our snow-fighting equipment is confined to rails as we have not experimented with motorized snow-fighting equipment except on our own premises. There is no question but that equipment of this type would help in our general snow-fighting program, but we have kept away from it on account of additional burdens that might be placed on us by city, state and municipalities.

We have two cars in our track department which are rigged up to salt track; they also have route cards which cover our grooved type of rail, all switches and low rail in the city area. To my mind there is no question but what the proper application of salt is very essential, especially in heavy snow which is easily matted down by autos. After the salt is spread the snow loosens up and is easily removed by car scrapers or sweepers.

Each switch cleaner has a territory to cover and barrels of salt are placed at various locations on these routes. Each snow plow and sweeper also carries a supply of salt which is used in low spots and on lines not covered by regular salt car routes. The average consumption of salt per year per mile of track the past season, which was a fairly mild winter, was about 1 ton per mile of track.

We are called on to move snow in certain downtown city streets. During the past winter we cleaned 3 miles of streets at an approximate cost of $2,500 per mile, the loading being done by hand, using teams and trucks to cart the snow away. At night we sometimes use a motor flat and trailer. We are unable to dump snow into our sewer manholes in Hartford, but outlets in several bridges allow us to dump snow into the Par River in the downtown section and also in the Connecticut River, where we dump with a very



Former Eastern Massachusetts Express Car Equipped with Broom Sweeper

Digitized by Google

short haul. In the case of snow trains as described above, the haul is considerably longer and at least 2 miles from the center of the city.

It is my belief that personal contact with the crews and a word of encouragement from time to time when the storm is raging are very helpful. We try to impress on them the responsibility of keeping their routes open.

Snow-Fighting Equipment and Methods

E. L. LOCKMAN
Assistant Engineer Surface Lines, Boston Elevated Railway

HANDLING of snow in a progressive community has undergone a considerable change from what it was some years ago when a certain amount of snow was left on the ground for the accommodation of vehicles on runners.

By law the Boston Elevated Railway is obligated to remove snow from the track area only. If snow is removed from the track area only vehicles will use the car tracks, thus delaying the car service. We find it is not only necessary to remove snow from the track area but also alongside the tracks to provide a roadway for other vehicles.

As time is the essence of snow removal, successful snow fighting calls for prompt, speedy action and special equipment is required.

In 1920 the company purchased its first piece of snow-fighting equipment other than car plows. This was a Champion snow plow. In 1922-23 we purchased our first snow loader. Two weeks after its receipt we purchased a second. We have added to this equipment from time to time. A list of the snow-fighting equipment owned by the company and operated by the maintenance department, exclusive of car plows, is as follows:

9 Barber-Greene snow loaders, 6 caterpillar tractors (5-ton) with steel plows, 3 Fordson tractors, 2 Walter truck snow fighters, 6 Differential cars equipped with snow plows, 3 rail cars equipped with side plows, 32 Champion snow plows for 5-ton trucks.

This equipment has a value of $112,888.

In addition the maintenance department operates 36 motor trucks varying from 7-ton of the Mack and White type to 1-ton Ford trucks. This equipment is used in regular service during all seasons of the year and is available for snow work when required.

CAR PLOWS

The company has a total of 162 single- and double-truck car plows are sixteen sweepers of both single- and double-truck type. The cost of maintaining the car plow equipment during 1925 was as follows: Car plows, $10,263.64; car sweepers, $2,763.49.

The cost of maintaining the Barber-Greene snow loaders, of which we had five in 1925, was $368.08.

From Feb. 5 to 24, inclusive in 1926 the following snow work was performed by the maintenance department equipment:

Cubic yards of snow removed		52,785
Truck loads		7,038
Number of trucks used		650
Average cubic yards per load		7.5
Average cost per cubic yard		$0.4688
Total cost		
Trucks	$18,822.48	
Operators	1,435.34	
Men with snow loaders and at dumps	4,490.44	
	$24,748.26	$24,748.26
No. of locations worked at		84

The average cost per cubic yard of snow includes hire of trucks and labor.

For effective snow fighting we find that a special organization is required both for the transportation department and maintenance department. Every man in the maintenance department, including the engineering force, clerks, etc., is assigned a place and used if the conditions require. The responsibility of handling snow is divided between the transportation and maintenance departments. The duties are responsibility of each department are well defined and understood.

The transportation department plows the car tracks and operates scrapers on the buses if necessary. The maintenance department operates all snow-fighting equipment exclusive of car plows and procures extra trucks from contractors for plowing bus routes, throwing back snow on car lines and for hauling snow; also extra trucks are provided and equipped for emergency and are stationed at several predetermined points on the system. These emergency trucks are equipped with blocks and falls, jacks and other tools for the purpose of removing stalled automobiles and other vehicles which break down on the car tracks. We found during the snow period of February, 1926, that this service was absolutely necessary in order that we might operate our car schedules.

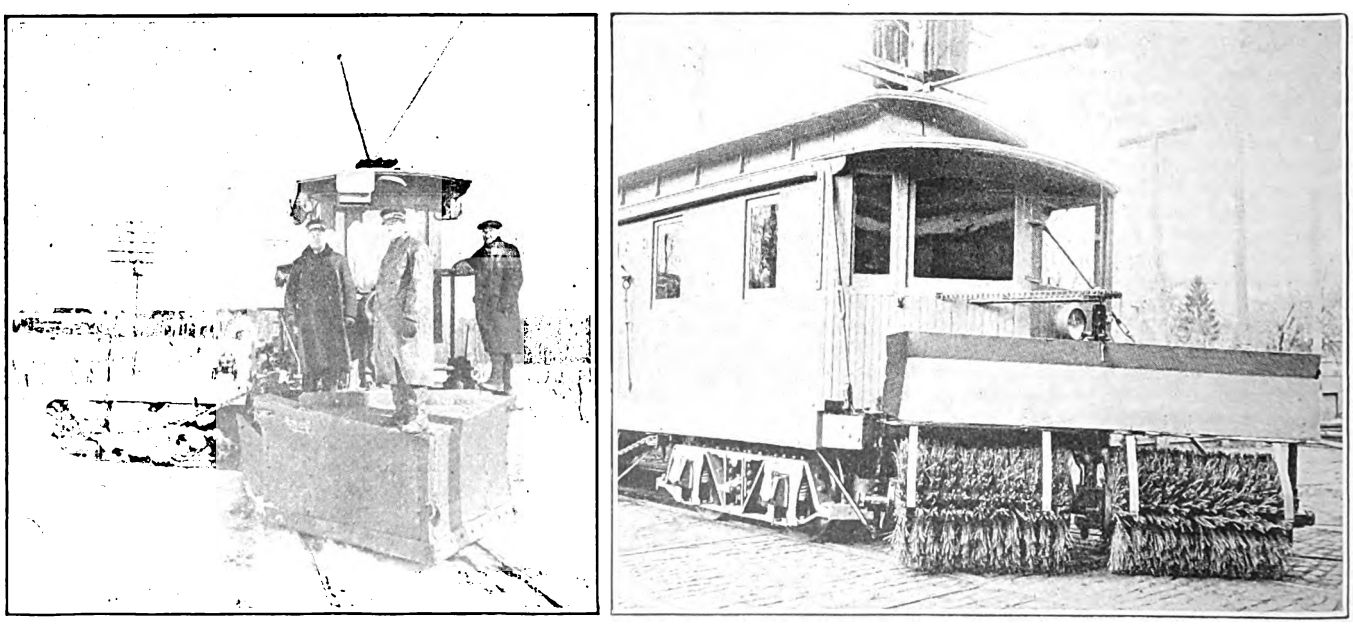
The maintenance department obtains permits for dumps for snow disposal. We have a total of about 60 sewer manhole locations for snow disposal and tidewater dumps located at various points in the system. We have a few land dumps, but land dumps are not desirable in connection with motor truck removal of snow.

To provide extra trucks necessary for snow fighting every fall we send out a questionnaire to local trucking concerns as to the number of trucks available and the price per hour, where located, etc., and during the season 1925-26 we had approximately 250 trucks on our list, available for snow work both for snow removal and for plowing.

During the past season we paid an average rate of $27 per day of nine hours for hauling snow and $36 per day of nine hours for plowing snow.

As before stated, we own 32 Champion snow plows for 5-ton trucks; 25 of these plows are used for hired trucks and seven for company trucks.

In addition to the car plow equipment we have found it desirable to equip certain service cars with side wings for throwing back the snow. We have three rail cars equipped with these



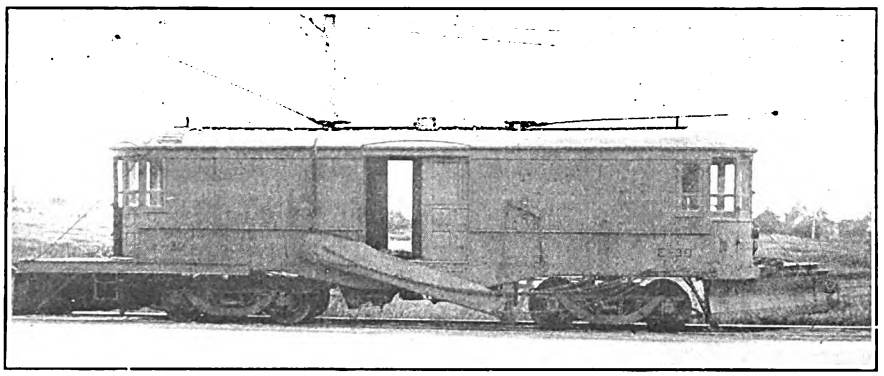
Eastern Massachusetts Equipment. At Left, Leveler with Nose Plow; at Right, Sweeper Rebuilt from Open Car

Digitized by Google

wings and six Differential steel cars equipped with front plows and we are now engaged in providing these steel cars with side wings similar to the side wings used with the rail cars.

During the heavy snow period of February the rail cars equipped with wings did wonderful work. No matter how deep the snow these cars had sufficient power to throw it back and provide a roadway of from 12 to 14 ft. wide alongside the car track for automobiles and other vehicles. Where streets were not of sufficient width to provide storage for this snow it was necessary to put out the snow loaders and remove it.

As to the relative advantages of equipment confined to rails and equipment not confined to rails, from our experience during the heavy storm of February, 1926, we found it would be necessary to have other apparatus than



Former Eastern Massachusetts Express Car Equipped with Shear Plow

plows and sweepers running on car wheels. When lines become tied up due to stalled cars or other vehicles breaking down on the track, so do plows and sweepers, at which time it is advisable to have on hand some other form of equipment that can go around the block and clear the line ahead for the stalled cars. For this work we believe the Walter snow fighter will be a very effective piece of apparatus.

The Walter snow fighter is in effect a six-cylinder, 80-hp., 7-ton truck of four-wheel drive, equipped with snow scraper blade and front patrol plow, and while it is purchased for use on bus lines it may be used on the system wherever its services are required.

The company also has on hand six 5-ton tractors equipped with steel plows. These tractors are the most powerful snow-fighting outfits we have and their only drawback is their slow motion, but for pushing back an accumulation of snow we believe they are unexcelled.

On tracks and special work we use an average of 2,000 tons of salt per year. As the miles of surface lines operated total 310,408, this is an average consumption of approximately 6.4 tons per mile.

The salt is purchased in bulk and is received in steam railroad box cars at our freight yard and from there distributed by service cars to several points on the system. When occasion requires it is distributed by special salt cars and motor trucks.

If the storm arrives late at night or in the early morning hours it gives us no particular concern. We have a free field for the operation of our snow equipment; but if the storm is of considerable proportion and arrives during the afternoon the situation is seriously complicated.

Before the storm arrives the supervisory forces of the transportation and maintenance departments report to their particular districts to which they are assigned. Station masters, with sufficient assistants, report for the purpose of assigning and detailing plow crews. The maintenance department assigns men to cover special work, passenger landings, rapid transit lines stations and rapid transit interlockings.

When the snow is from 1 in. to 2 in. deep car plows are sent out. If the storm increases in intensity the plow routes are shortened and additional equipment put on as needed.

Motor trucks, properly ballasted and with front plows, are sent out by the maintenance department as previously arranged to throw back snow from where it is deposited by the car plows and also to keep bus routes open. Other motor trucks equipped with jacks, blocks and falls, etc., and known as emergency trucks, are assigned to certain locations to assist the regular wrecking crew in removing broken down vehicles or vehicles that have become stalled on the car lines. Entrances to hospitals, public buildings, police stations, etc., are kept clear of snow.

About three hours after the storm is over, so abutters can clean their sidewalks the maintenance department sends out snow loaders to remove the snow from narrow streets and streets from which it has been agreed to remove one half the snow or from curb to curb. The amount of snow removed depends on the condition of the streets previous to the storm and the weather conditions following the storm.

During the night following the storm and as often as required service cars equipped with special side plows are sent out to throw back the snow toward the curbing. As before stated, this equipment has been found to be very efficient as it provides a roadway of from 12 ft. to 14 ft. in width from the car rail toward the curbs, and in this way we entice the automobile traffic to keep off the car tracks.

After every storm the snow equipment, of whatever type, is returned to its own station for inspection and repairs, if repairs are necessary, and there it is put in readiness for the next storm.

Rolling Stock

REPORTS of chairmen of special committees in the rolling stock division outlining the work to be undertaken during the coming year occupied a two-day session of the standing committee on rolling stock held at association headquarters, New York, Dec. 13 and 14, 1926. Those present at the meeting were A. T. Clark, chairman; W. S. Adams, V. W. Berry, W. C. Bolt, W. W. Brown, R. S. Bull, R. W. Cost, F. J. Foote, M. R. Hanna, J. M. Hipple, E. A. Hutchins, J. S. McWhirter, T. H. Nicholl, Hugh Savage, R. B. Smyth, C. W. Squier and W. G. Stuck.

In a review of Manual sections special attention will be devoted to revising that for couplers and the location of end connections on interurban cars. Specifications for gears and pinions will be revised by special committee No. 10 on gearing. It was decided to recommend to the executive committee of the Engineering Association that special committees be formed to take up revision of standard journal boxes and the establishing of additional limits-of-wear standards.

The committee that is studying motor coach design and maintenance methods will go over the specifications proposed by the Society of Automotive Engineers through its motor coach division for the New Jersey Board of Public Utility Commissioners, and it will also review the inspection schedules as published in the 1926 equipment committee's report.

In order to arouse interest in the subject of appearance, comfort and convenience of cars, a study of which is being made by special committee No. 3, a special campaign will be instituted. This will consist of a number of articles by men who are accomplishing particular improvements in the appearance, comfort or convenience of rolling stock on their properties, these articles to be published in ELECTRIC RAILWAY JOURNAL. Others will also be requested to submit letters for publication discussing the subject and outlining what they consider essential.

The study of car lighting being made by special committee No. 4 will include recommendations for the lighting of typical surface cars. Additional lighting tests will be conducted in order to secure data and a report on the number and sizes of lamps now available will be made, together with a list showing the demand for the various types in electric railway car service.

Discussion of results being obtained from roller bearings in European countries brought out that increased interest is being manifested and that the study being made by special committee No. 5 should prove valuable.

Committees which are studying side wear of brushes in ventilated motors, noise reduction in car operation and current collecting devices outlined the work which will be undertaken.

Professor Seligman Addresses Tax Committee

REGULAR and advisory members of the American Association taxation committee were addressed at a luncheon meeting held in the Engineers Club, New York, on Nov. 10, on the subject of the gross-net tax by Prof. E. R. A. Seligman of Columbia University, nationally known economist. Professor Seligman cited experience with this general form of taxation where it has been applied, and recommended it as a means of securing more equitable distribution of the tax load on business.

In discussing the taxation of utilities, and particularly the electric railways, he decried the unfairness of the burden now carried. He pointed out, however, that this was in large part attributable to unwise effort in the past to avoid a fair share of the tax burden. He held that no business could afford to dodge its fair share of taxes, but agreed that utilities are justified in striving to equalize their taxes with those carried by other forms of business.

During a morning session at association headquarters, and following Professor Seligman's talk, the committee discussed the advisability of undertaking a program to stimulate industry-wide advocacy of the gross-net system of taxation for electric railways. It was the purpose of the committee first to determine the sentiment of its own members regarding the principles of gross-net taxation and after that to undertake a study of the practical problems of its application.

There was some difference of opinion as to the advisability of an indorsement of the principle advanced or of advocacy by electric railways of any particular system of taxation. Such an indorsement was finally passed, however, with a number of members not voting. A sub-committee was appointed to make a further study of the gross-net method and to prepare a report on the subject for submission to the committee, and if approved to the executive committee.

Those present included the following; regular members, Chairman A. T. Davison, general counsel Third Avenue Railway, New York City; H. Allen, comptroller Chicago Surface Lines; Robert M. Feustel, president Indiana Service Corporation, Fort Wayne; H. L. Geisse, general manager Wisconsin Valley Electric Company, Wausan; W. A. Jackson, vice-president the Milwaukee Electric Railway & Light Company, L. R. Nash, operating vice-president Stone & Webster, Boston; C. L. S. Tingley, American Electric Power Company, Philadelphia; and W. J. Wright, assistant general counsel Public Service Corporation of New Jersey, representing Senator E. W. Wakelee. Advisory members at the meeting were W. J. Flickinger, Connecticut; A. W. Brady, Indiana; J. L. Swope representing C. D. Emmons, Baltimore; E. M. Walker, Schenectady; H. B. Cobban, Oklahoma; E. B. Griffiths representing A. W. Robinson; E. J. Dickson, Rhode Island; T. J. Moore, Virginia; Managing Director L. S. Storrs, J. W. Welsh, executive secretary, and Leslie Vickers, economist of the association staff.

Parking No Aid to Merchants*

By F. C. Fox
Assistant to President A. I. Namm Company, Brooklyn, N. Y.

THE merchant today is seriously interested in the transportation problems. First, I think, I ought to indict the merchant as being guilty of producing a great part of the present traffic congestion. The downtown shopping district has become an institution. A number of large department stores have been established in one section. We spend millions of dollars annually to bring people to that section from all the outlying districts. We have created this vast movement and, having built up this tremendous congestion, now we are crying for help.

It is not quite right to say that the merchant is selfish and wants his customers to park around the store and in the streets adjoining the store, because he doesn't. We made a check recently to ascertain what benefit we received from the automobiles parked around our place of business. We front on Fulton Street, which, of course, is a two-track street. The rear is on Livingston Street which is likewise a two-track street. We found in the check-up that 75 per cent of our customers came to the district via subway or elevated, 24 per cent arrived by surface cars and 1 per cent presumably walked or came by automobile.

There were 118 automobiles parked from 9 o'clock in the morning until 5 o'clock in the afternoon on Livingston and Hoyt Streets and Elm Place. From those 118 cars 80 customers came into the store, and just think what those 80 customers did to traffic on Livingston Street. They practically eliminated all of the road area except that section of it on which the surface cars were operating, so that these 118 automobiles impeded thousands of people.

We do not desire that condition and we are going to do our part to eliminate it. Congestion that we have helped to create is now undoubtedly seriously interfering with our business. It has become such a serious problem that when the Department of Commerce recently sent out a questionnaire to practically every merchant in so-called downtown shopping districts, these merchants agreed that this congestion is interfering with traffic so seriously that unless something is done the downtown shopping district will soon be a thing of the past.

We are not selfish; we believe in living and letting live, but we are alarmed to see the number of neighborhood stores springing up. A few years ago the grocers, the butchers, and the like, were practically the only neighborhood stores. Now, because of traffic difficulty, we find all sorts of shops, specialty shops, springing up in almost every residential neighborhood in the city. We are perfectly willing to let them have business, but we don't want them to take our business away from us, because in the creation of this business we have made a huge investment in real estate and in building up good will. Decentralization would mean that the money we have spent for the good will and invested in our plant would be seriously jeopardized.

One of our neighbors tried the private parking proposition. A garage was hired and had two uniformed men to take the customers' automobiles from the store to the garage and bring them back again without any charge for the service or for the parking. But such is the selfishness of human nature, that the customers, realizing it would take a few minutes to get the automobiles, that they would be a little inconvenienced by this arrangement, refused to permit it, and the store finally gave it up in despair. Thus the much-heralded means of preventing parking around department stores by providing garage space, I am afraid, is doomed to failure. People simply will not do it.

At the present time there seems to be an insidious sort of propaganda, and I don't know where it comes from, that the street car is the source of all traffic evils, and the remedy proposed is the bus. I may not know much about it, but I think the remedy is a little worse than the evil. As has been said, the street cars stop on every corner, but I suppose the bus will have to stop somewhere too. The street car with its definite lane of travel carries about three times as many passengers as the bus, and it certainly is not causing the congestion that the bus is causing.

Buses are good things, but not good enough to supplant the surface cars. They are good things as auxiliaries to surface cars, but they should be in the hands of organizations skilled in transit. We have had some experience along that line. Once we tried to give some of our delivery to an unskilled organization. The result was chaos and we had to turn it all back to our own organization trained in that business. They soon straightened it out.

I don't believe that putting buses on the streets, particularly on the main thoroughfares, is going to help us very much. It certainly isn't going to help the Police Department very much in controlling traffic, nor the public very much, unless the buses are in the right hands.

I believe if all those interested in the traffic congestion problem will get together with the powers that be, the city fathers and so on, and work out a solution of this problem, they will find a way out. I hope so from a selfish point of view, because if they do not, eventually there is going to be decentralization of the mercantile business. It will have to branch out like the banks, establishing branches in every section of the city. That will not benefit the public, because it will increase the cost of merchandise, and the public is going to pay. From the point of view of a centralized merchant I feel that this traffic problem is so important that all the merchants are right in bending their best efforts and giving all the assistance possible to those interested in improving traffic conditions.

*Abstract of a paper presented at a meeting of the Metropolitan Section A.E.R.A., New York, N. Y., Dec. 3.

The News of the Industry

Merger of East Bay Transit Facilities

Key System Transit Company and Southern Pacific Likely to Merge Lines in Interest of Economy and Efficiency

Important changes in East Bay electric railway and ferry service are forecast by the announcement that the Southern Pacific and the Key System Transit Company, Oakland, Cal., are about to merge all or part of their lines in the interest of economy and efficiency.

Close on the heels of this revelation comes the statement that the Western Pacific is negotiating for the purchase of the Sacramento Short Line and that the stockholders of the latter road are about to vote on this question.

Students of railroad affairs see in these announcements a new development in the contest waged for some time between the Southern Pacific and the Hill interests. The latter are seeking a "place in the sun"; in other words, a new Pacific Coast terminal.

An ideal terminal exists in the East Bay, where the Key mole is located, just a little way up the bay from the Southern Pacific mole. The Hill interests are known to have "flirted" with the Key officials over its prospective purchase. But the Key officials have been wary. Their ferry and electric train service are the best paying portions of their holdings.

To complicate the situation, the Key lines have an agreement with the Short Line by which the latter is permitted to run its trains through the streets of the East Bay and to the mole. If the Western Pacific, through its adjunct, the Sacramento Northern, an electric road, should acquire the Short Line, it would also purchase the right to use the Key mole.

The Western Pacific has a terminal in Oakland, but it seeks a shorter route to the north than it now has. Its auxiliary, the Sacramento Northern, runs between Chico and Sacramento. In the event of the purchase being approved by the stockholders of the Short Line, it is said that the Hill lines, the Northern Pacific and the Great Northern, through their subsidiary, the Oregon Trunk Line, would build a link from Klamath Falls in Oregon to Chico and then run trains over the Short Line tracks to the Key mole.

Officials of all the roads concerned have admitted that the negotiations are in progress and that there is "something doing." Walter Arnstein, president of the Short Line, stated that the stockholders of his road will shortly vote on the matter of the purchase and C. M. Levey, president of the Western Pacific, also admitted that the deal is under way.

Key officials are equally frank, but declare that at the present time plans are tentative. C. O. G. Miller for the Key System Transit Company asserted that surveys are in progress by engineers of the Southern Pacific to determine how some of the duplicate service of the two ferries and electric lines can be eliminated in the interest of efficiency and economy.

Regardless of what plan or plans are finally adopted, it is likely that the ferry schedules of the two lines will be alternated and that commutation books will be made interchangable. This is a plan that has long been considered and one that will meet with popular favor.

Under another plan considered Key System trains will practically cease to run to Berkeley and East Oakland, those two sections being given over to Southern Pacific service almost exclusively. In turn, it has been suggested that the Southern Pacific abandon its Central Oakland service in favor of the Key.

Mr. Miller also admitted that still another plan being considered is one that calls for a merger of the Key and Southern Pacific electric lines and ferries through the formation of a holding company, each line to keep its own operating head. Under such an arrangement, it is pointed out, great economies could be effected and a reduction in rates would probably follow.

It is expected that Paul Shoup, executive vice-president of the Southern Pacific, will have final say as to which of five plans is to be chosen. He has been in the East for some time.

Key officials declare that the recent raise in railway fares from 6 to 7 cents, which was expected to bring more revenue, has failed of its purpose and that no financial relief has been afforded.

Chicago Coach Hearings Start Dec. 21

Motor Interests That Would Supplant Street Cars Want Adequate Return —Say They Cannot Be Silenced by Arrogance—Backed by Big Bankers, Including Seligman and Guaranty Trust—One Side Says It Can't Be Done, Other Says it Can

JOHN A. RITCHIE, president of the Chicago Motor Coach Company, was the chief witness at the public hearing called on Dec. 10 by the committee on local transportation of the Chicago City Council to consider the proposal of his company, submitted to the Mayor and the Council on Dec. 8. This proposal, it will be recalled, contemplates that the motor coach company shall be permitted to take over the functions of the Chicago Surface Lines in supplying comprehensive city-wide transportation in Chicago after the expiration of the railway company's franchise next February.

The discussion on Dec. 10 was preliminary and really constituted the first of a series of hearings on the matter to begin Tuesday, Dec. 21. In this series of hearings it is expected that such points as cost of operation, compensation to the city, capital investment, flexiblity of operation, relative speed, capacity of vehicles, existing litigation, economic use of street space, paving, etc., will be taken up.

Adequate Return Wanted

At the preliminary hearing Mr. Ritchie outlined in general the company's plans. He said that as to the whole contract "the city can write its own ticket, so long as we are enabled to earn an adequate return." Little more than the barest essentials of the plan were touched upon, however, and no definite action or results can be expected until after the investigating committee has delved into the matter thoroughly.

Mr. Ritchie's appearance before the committee drew a vast throng of city officials, Surface Lines executives and representatives of the trainmen's union. By way of preface Mr. Ritchie declared that his company's long experience and financial responsibility qualifies it to undertake this great enterprise. Among the bankers who have approved the plan and stand ready to finance it, he mentioned the Foreman Trust & Savings Bank, Chicago, and the Guaranty Trust Company and J. & W. Seligman Company, New York. The discussion at this meeting followed along much the same lines drawn in the letter originally addressed to the committee, but Mr. Ritchie was kept busy answering the questions and criticisms of the none too credulous Aldermen. He seemed undisturbed by the many queries and objections thrown at him by the Aldermen. At the close of the hearing, he conceded that if provision was made for a reasonable return on the investment, the city could write any kind of a franchise and "we will meet your terms."

Mr. Richardson Answers Mr. Ritchie

Some of Mr. Ritchie's arguments in his original proposal were answered by Guy A. Richardson, vice-president of

Digitized by Google

the Chicago Surface Lines. He was quoted as follows in the Chicago *Tribune:*

The bus lines so far this year have fallen off 4 per cent in passengers, while the street cars have made an increase of more than 4 per cent. When the novelty wears off the public comes back to the street car the old trustworthy transit, rain or shine sleet or ice, hot or cold.

If buses are to give city-wide service certain things would have to be cared for first. Let me enumerate some of them: greater frequency of buses at ends of lines service at all hours of the day, a greatly increased ratio of rush service to non-rush reasonable head room, pneumatic tires, air brakes for safety, working conditions and wages, heating and ventilating, taxes and street charges for paving. Even the change to pneumatic tires, which would cost 1½ cents a bus-mile, would wipe out the present profit from operation.

If these factors were cared for, as they are by the street car lines, the fare by buses would be closer to 15 cents than 10 cents.

Mr. Richardson discussed the buses in London, which were used as an argument in the proposal of the Motor Coach Company. He is quoted:

Conditions in London and Chicago are not comparable. In London the tramway is the workman's vehicle. He gets a special rate at rush hours. So the buses do not start operating until 8 a.m. and they cut off service, except on main thoroughfares about 8 p.m.

The buses carry the great bulk of the London traffic. But the average ride in London is less than 1 mile, as compared with 4½ miles for the Chicago street cars. They keep hopping on and off in London.

If London buses carried their passengers as far as do the Chicago Surface Lines, London would require three times as many buses as now. London's volume of traffic is on a different basis than there.

They have few private automobiles; traffic is mostly taxis, buses, and commercial vehicles. Tramways are excluded from the old city of London, which is about 12 square miles. The buildings are low, no skyscrapers, the people are more widely distributed, many of them walk to work, they are not centralized as here in the downtown district. Yet last year the London transportation committee curtailed the number of buses on account of the great congestion. So much for London.

Mr. Richardson discussed the Fifth Avenue buses of New York:

The Fifth Avenue Coach Company operates on the finest sightseeing street in the world, yet after 30 years and more as a company it has been able to justify using only about 300 buses in the largest city in the country.

The present speed of buses on Fifth Avenue is less than 4 m.p.h. all afternoon, and between 5:15 and 6:15 p.m., between 32d and 52d Streets it is only 2⅔ m.p.h., or less than a walking gait.

This is not transportation and should be forced off the street to let other fast vehicles have a place. Five subway trains per hour would handle more people than do the Fifth Avenue buses, and at 25 m.p.h. instead of 2⅔. Fancy taking 22 minutes regularly to travel a mile!

The bus company claims it could do the work of Chicago's 3,539 street cars with 4,685 buses. It would be impossible—the load is too high. It would take at least 6,500 buses at a minimum to serve Chicago if paving, street clearances, and so on were arranged so that they could operate.

The price bid by Yellow Coach for such a type bus for Detroit this year was $12,125 without tires. So 6,500 buses at $12,500 with tires would cost $81,000,000. This would represent the investment in buses alone.

The present investment of the Chicago Motor Coach Company, in land, buildings, shops, garages, coaches and equipment necessary for present operation is about $6,900,000. Coaches alone make up about $3,700,000, or about 53 per cent of total necessary investment. The figures are from records on file with the Commerce Commission.

If this ratio holds good, and it should, the total investment needed for a system of 6,500 buses would be about $150,000,000. If there are only 4,700 buses, the total would be at least $110,000,000.

The bus proposal, interpreted by some to mean the wiping out of the entire capital investment of the Chicago Surface Lines without return to the investors, has brought some rather severe criticism. The *Journal of Commerce* said editorially.

The street car lines which Mr. Hertz proposes to supplant are now giving Chicago the best surface transportation of any large city in the world. Of course there is overcrowding and there is straphanging, and some of the motormen and conductors are surly fellows. This, that and the other complaint is true. But the Chicago street car lines are not here being compared with limousines or parlor cars; they are being compared with street car lines in other large cities. And the Chicago street car service is better than that in any other large city.

An enormous number of people are carried at peak hours in the early morning and the late afternoon, and there has to be straphanging just as there has to be a busy signal on the telephone wires at peak hours. The street car public would lose much of its discontent if it could be frequently transported to other large cities in order to experience the service there at the rush hours.

That it would be possible to junk the great surface transportation plant and perform as good a service by buses, does not seem reasonable to the observer.

And yet if it be assumed that all that Mr. Hertz says is true, still there is a moral objection to the junking of the street car lines. There is a plea in equity for the people who have lent many millions of property to give Chicago the best street car system, and whose investment would be destroyed if street cars were abandoned.

Twenty years ago the street car franchises were given. It was then agreed that at the expiration of the franchises on Feb. 1, 1927, the city should have the right to buy the lines at a contract price. Fifty-five per cent of the net receipts was set aside for a traction fund, which would constitute a large part of the price the city would pay for the property.

The obligation now rests upon the city either to buy the property as agreed twenty years ago, or else to permit a continuation of service. Any other course would be an injustice to the investors who twenty years ago, and by means of purchase of bonds since then, have supplied capital which now should either be returned to them by means of city purchase of the lines, or which should be permitted to continue earning returns.

It is unlikely, however, that the moral obligation will be much considered by the City Council. It is one of the axioms of popular philosophy that an investor in a public utility is always a villain, and that every dollar that can be squeezed from him is a dollar laid upon the altar of righteousness. Therefore moral objections to the junking of the street car lines will not count. But practical objections count immensely. Aldermen will be wary about creating a situation in which people who want to go to their work cannot find a way to get there.

MR. RITCHIE ANSWERS MR. RICHARDSON

Officers of the motor coach company were quick to reply to these criticisms. Mr. Ritchie did so in a statement made public on Dec. 13. Another communication was dated Dec. 12. In addition still another statement was made in which some of the reasons were advanced why a city-wide motor coach system "could meet the existing requirements of surface transportation in Chicago better and more quickly than any other form of local service," but in the interest of brevity and avoidance of technicality, other important features were merely mentioned, leaving more detailed consideration to this further letter and "to conferences with your body."

In his statement of Dec. 12 Mr. Ritchie served notice "that we cannot be silenced by arrogance, glittering generalities, and misstatement any more than the people who are suffering because of lack of proper transportation can be silenced by such. The time has passed when deception can triumph." He felt a questioning attitude to be natural, proper and reasonable, but his response to those who said that "it can't be done," namely, furnish a city-wide system to carry all of the passengers now being carried by the street cars, was: "We can do it."

These various communications in behalf of the bus company run to the extent of 24 closely typewritten pages. It is impossible to do more than indicate the scope and the tenor of these statements. Mr. Ritchie replied to several of Mr. Richardson's criticisms and then said that "there would seem to be no reason to analyze in detail the other statements made in the article referred to (the *Tribune* article). It is evident that Mr. Richardson was incorrectly reported or spoke without authoritative data, giving general impressions rather than readily ascertainable facts." At another point Mr. Ritchie said that "whatever opposition modern motor coach service meets is of the kind that was met by the printing press, weaving machinery, great beef-packing plants, elevated railroads, etc., and which always arises to oppose a better way of doing old jobs. Old established interests suffered, but society as a whole is entitled to the fruits of civilized progress."

The general communication, to which reference has been made, says:

A city-wide motor coach system such as we proposed in our letter could, better than any other type of street surface transportation, be co-ordinated with rapid transit lines in Chicago easily, quickly, and without impairment of capital, or the necessity of any large new investment. This can not be said of any other existing type of surface transportation.

The first official confirmation of the plan, to supplant local street car service by putting 4,200 additional buses on the streets of the city was evoked on Dec. 7, when John Hertz, chairman of the motor coach company, held a conference with Mayor William E. Dever for the purpose of obtaining a hearing before the local transportation committee. Representing that such a plan is not only possible but commercially feasible, a letter signed by Mr. Ritchie, president of the company, and seeking to "work out with the committee a complete plan of motor coach transportation for Chicago, which in our judgment, will result immediately in great public advantage," was accordingly laid before the local transportation committee the following day.

The letter of President Ritchie to William E. Dever, Mayor, and the City Council follows:

By reference to the volume published by Al. F. Gorman, city clerk, in November, 1924, entitled "Sundry Proposals and Plans for the Development of Local Transportation Facilities in the City of Chicago," it will be found that on Sept. 24, 1924, we called attention to the fact that the Chicago Motor Coach Company could serve the city of Chicago and its people with greatly improved transportation facilities.

Since that time we have given further study to the subject and are now in a position to work out with you a complete plan of motor coach transportation, which, in our judgment, will result immediately in great public advantage.

Notwithstanding the case now pending in the Supreme Court of Illinois between the city and our company, involving certain legal questions, and having in mind the importance to the city of Chicago of an early settlement of its surface transportation problem, and agreement can be entered into between us which will bring about a prompt solution of the problem. This agreement would be binding on the city and our company, no matter which side is successful in the pending litigation.

Brooklyn City Employees Receive Safety Bonus

© Underwood & Underwood.

Left to Right, N. R. Nay, James Prundy, William Preisendorfer, Borough President James J. Byrne, Everett Merrill, Michael Ford and John Walker

Approximately 86.4 per cent of the 2,172 motormen, conductors and safety car operators in the employ of the Brooklyn City Railroad participated in safety bonuses distributed on Dec. 15. This was in accordance with the new plan inaugurated by the company on Aug. 1 of the current year, under the terms of which platform employees receive $5 for each 30 days of work completed without a chargeable accident.

Distribution of the bonuses was made at each of the carhouses with appropriate ceremonies, at which C. E. Morgan, vice-president and general manager of the company, and Borough President James J. Byrne of Brooklyn presided.

Failure to report any accident in which the company's cars may be involved is cause for loss of the bonus by the men responsible. In determining chargeable accidents under the terms of the bonus plan, responsibility on the part of the crew is determined by the management after investigation.

Since the plan has been in operation for a period of only four months during the current year, the maximum bonus which could be earned by any employee was $20. During a full year the maximum amount which can be earned is $60. Nineteen of the 1,876 men participating this year received the maximum amount. Of the remainder, 747 men received awards for three 30-day periods, 727 for two periods and 383 for one.

Summarizing the results accomplished, Vice-President Morgan states that accidents of all types were decreased 35 per cent in the month of October from the total of the corresponding month in 1925 and that this rate of decrease is being maintained from month to month.

We propose giving Chicago a complete installation of modern double-deck motor coaches, serving not only the people now served by the Surface Lines, but extending the installation to localities at present without any service.

The motor coaches to be furnished would be of the most recent design, with the upper decks fully inclosed, so that the full seating capacity would be available at all times of the year under any weather conditions.

We propose to furnish a sufficient number of motor coaches so that during rush hours there would be available 290,000 seats as compared to 156,000 seats now provided by the Surface Lines.

In rush hours, because of increased schedules, approximately eight motor coach passengers out of every ten would have seats, compared with present conditions on street cars where approximately four passengers out of every ten have seats.

During non-rush hours, based on the same schedules as present street car operation, our service would furnish 40 per cent more seats than are now provided by the street car system.

Express or "limited stop" motor coach lines would be installed, furnishing quasi rapid transit service, thus saving large numbers of passengers an appreciable amount of time. This type of service is needed, yet it cannot be rendered by any street transportation agency operating on rails.

By reason of long experience and financial responsibility, we feel qualified to undertake this work, and, therefore, ask that full consideration be given this communication.

The modern large capacity motor coach is a more efficient carrier than the street car, due to the marked improvement in construction in recent years. There has been little progress in recent years in street railway systems; the mileage has failed to keep pace with transportation needs, and the present tendency is to avoid adding new mileage. The motor coach, on the other hand, is expanding and interesting the best engineering, economic and financial thought of the country.

The art of motor coach design and construction has developed to the point where mass transportation can be adequately handled by the motor coach. The motor coach has already demonstrated in actual service in London its ability to handle large masses of people, notwithstanding that the type of motor coach used is less in carrying capacity than the type we propose to use.

In London, in 1925, an average number of 5,500 motor coaches, with an average seating capacity of 47 persons, carried 1,671,000,000 passengers, or more than were carried by any other facility in that city; more than were carried by all street car and motor coach systems in Chicago; more than were carried by the entire Interborough Rapid Transit Company's system of subways and elevated railroads in New York City; and nearly twice as many as were carried by all of the steam railroads of the United States together, as reported by the Interstate Commerce Commission. This is mass transportation!

For the proposed city-wide operation in Chicago, the fully-inclosed, double-deck coach will seat 62 passengers and will be designed to accommodate comfortably a small number of standing passengers on the lower deck. The question of increasing the carrying capacity of the motor coach for the accommodation of a reasonable number of standees is a simple engineering matter.

In Chicago the street cars have an average seating capacity of 44, and, in rush hours, carry more standing that seated passengers.

The Surface Lines in Chicago could not carry passengers at present cost except for the large standing loads.

On the proposed system, 134,000 more seats would be provided than are now available on the Surface Lines, with only a small standing load.

In the proposed motor coach system, approximately 80 per cent of the investment would go to provide motor coaches and 20 per cent for garages, repair shops and working capital; while on the Surface Lines only 21 per cent of the investment is in street cars and approximately 79 per cent in other items, only a small part of which is for car barns and shops, the major portion being for track construction, overhead electric system, power plant equipment and other items not needed for motor coach operation.

The total capital investment for the proposed city-wide motor coach operation in Chicago would be less than one-half of the present value of the Chicago Surface Lines as reported by the Board of Supervising Engineers.

The length of the average ride per passenger on the Surface Lines in Chicago is about 4 miles. On the present motor coach system, operating largely on the boulevards, the average ride per passenger is about 6 miles.

The larger volume of business, the flow of traffic to and from the large number of business and industrial centers throughout the city, the large amount of two-way riding, the shorter average ride, together with other factors, all incidental to a city-wide operation, account materially for the difference in the present motor coach and street car fares.

Considering the lower investment and other elements as now existing making up the cost of carrying a passenger, with the advantages incident to a city-wide operation, the cost of carrying a passenger on the proposed city-wide motor coach installation would, under reasonable terms, be approximately the same as that on the Surface Lines.

The cost of street car operation per mile operated is 34.03 cents, and the cost of motor coach operation under our proposed plan would be 34.92 cents.

The trend of public thought in Chicago is toward co-ordination of all local transportation systems. There is also a public demand for additional rapid transit in order that a larger number of our people may enjoy its benefits. The proposed motor coach system lends itself to a co-ordination with rapid transit more readily than any other form of surface transportation.

We favor early co-ordination with rapid transit and stand ready at all times to co-operate to obtain it.

The flexibility in operation of the motor coach makes it possible to rearrange routes in such a way as to bring the people in contact with rapid transit without the delay and expense incident to reconstruction of surface lines.

Such readjustment by the motor coach can be made without impairment of, or increase in, invested capital, which cannot be said of any other transportation agency.

There are many factors which make motor coach transportation desirable in Chicago, touched upon generally in this letter, and which will be further elaborated in detail in personal conference with your transportation committee.

Less street congestion—the total street area covered by 3,539 street cars in operation is 1,443,912 sq.ft. and the total street area covered by 4,685 motor coaches in operation (the number proposed under our plan) would be 1,124,400 sq.ft., a saving in street area of 319,512 sq.ft., or 22 per cent.

No street car tracks, with the accompanying tearing up and laying down.

No trolley poles or overhead wires.

Motor coach service reflects the modern tendency for quality in matters of business and recreation. It provides safe, smooth, comfortable and healthful transportation.

The motor coach is readily adaptable, without material initial expense, to any development of Chicago's comprehensive plan of civic improvement.

No long construction period required. We estimate that a substantially complete service could be ready in six months.

We can install a complete system on the basis of a twenty-year term.

It is the most comfortable city transportation offered the public.

Faster movement through congested traffic.

The breaking down of a motor coach does not delay other motor coaches.

Wire and power house troubles are absent.

Disabled vehicles and other obstacles can be readily passed.

Deviation may be made from regular routes in case of fire, accident, parades, etc.

Fewer accidents, since coaches stop near the curb. The curbs stops make for greater safety, particularly in the transportation of children to and from schools and elsewhere.

Quieter operation.

Advantages to the city's popularity in showing visitors the city under the best transportation conditions.

Whenever it appears to the Illinois Commerce Commission—which, under existing law, has jurisdiction of our service—that

Digitized by Google

the public will be best served by the carrying out of our plan, we believe that its members will aid in such development and consummation.

The subject of fares, transfers, period of contract, capital investment, extension of routes, the right of the city to acquire, compensation to the city for the use of streets, and many other factors necessary to consider, are matters which have received our thought and attention. We are desirous of conferring with you to work out a plan which will meet with public favor.

Transit Survey in San Francisco

The city supervisors of San Francisco have adopted a motion appointing a joint committee of finance and public utilities committee "to survey and study problems of transportation in this city and county, with particular consideration of early expiration of important street railway franchises, and report recommendations for acquisition of all privately owned street railway lines in operation here and efficient consolidation of such lines with the Municipal Railway." The resolution relates to the important Market Street Railway franchises which the city claims expire in two years and the company in four. The joint committee is empowered to appoint a citizens' advisory committee.

Seattle in Crisis

Taxpayers Who Maintain Interest in Municipal Railway See Affairs of Road Hopelessly Involved—Mayor Favors Refinancing and Would Buy More Cars

UPON request of S. B. Asia and the "fourteen taxpayers" who have maintained a lively interest in the affairs of the municipal railway at Seattle, Wash., City Comptroller H. W. Carroll has furnished data which Mr. Asia says show the lines to "have reached a crisis financially." Although $4,236,500 has been paid on the bonded debt, accrued depreciation is estimated to total $4,794,688. Mr. Asia also points out that the railway's financial dilemma is further aggravated by the fact that it went on a warrant basis on Dec. 10 to pile up funds to meet approximately $1,150,000 in bond principal and interest due on March 1.

Mr. Asia further points out that the railway must reimburse the Puget Sound Power & Light Company to the extent of $600,000 for taxes paid on railway property for the year 1919 and interest, together with court costs. He states this liability will increase the deficit from $769,427, the amount now recorded, to more than $1,300,000.

As for the accrued depreciation amounting to $4,794,688, for which no sinking fund provision has been made, this is declared to mean that when the useful life of the plant is ended there will be no funds to replace it, because the laws of this state prohibit the issuance of bonds for replacement purposes. Mr. Asia said:

> I maintain that it is the height of folly to assume that the railway is making good when the facts are that there is a large deficit, or excess in liabilities over assets in the railway fund, and that this deficit is increasing daily. While bond installments are being paid, working capital on hand is diminishing each year as the deficit grows, and no funds are being laid aside for replacement of plant.

MR. ASIA'S SEATTLE SUMMARY

Date	Deficit	Surplus
April 1, 1919 (5c. fare)..	$70,453.82	
April 1 to Dec. 31, inc., 1919 (5c. fare).....	507,425.92	
Year 1920 (5c. and 6½c. fares).....	1,236,283.60	
Year 1921 (6½c. and 8½c. fares).....		$226,588.29
Year 1912 (8½c. fare)...		710,083.95
Year 1923 (5c. and 8½c. fares).....	107,868.14	
Year 1924 (8½c. fare)...		369,430.78
Year 1925 (8½c. fare....		25,746.01
Year 1926, first nine months (8½c. fare)...	179,244.67	
	$2,101,276.15	$1,331,849.03
Net deficit September 30, 1926.....		769,427.12
	$2,101,276.15	$2,101,276.15

On the other hand, Finance Chairman E. L. Blaine of the City Council, pointed out that on Dec. 31, 1920, the city railway fund had a deficit of $2,100,537 brought over from Division A and growing out of the first 21 months of operation on an inadequate fare. Five years later, on Dec. 31, 1925, this deficit had been reduced to $590,182, a total reduction of $1,510,354, he states.

On Dec. 31, 1920, bonds to the amount of $17,315,000 were outstanding. Five years later this had been reduced to $14,299,500, a net reduction of $2,915,500, despite the issuance of additional securities between these dates, Mr. Blaine claims. The actual payment on bonded indebtedness during this period was $4,846,191.

In addition to the above decrease of $1,510,354 in the deficit, according to Mr. Blaine, and the net reduction of $2,915,500 in the capital investment, the system paid $5,606,000 in interest, making a total payment of $10,031,854 over and above all operating, maintenance and other overhead expenses. He said:

> I submit that this is a pretty good showing for a business that is approaching bankruptcy. All this has been accomplished in spite of persistent attempts to discredit the system on the part of those agencies in the city which should be interested in building up rather than tearing down the industries of the city and whose very existence is dependent upon adequate transportation being furnished our citizens.

Just prior to the announcement by the Clearing House of Seattle that it would refuse to cash railway warrants, Mayor Bertha K. Landes issued a statement on the railway situation in which she made the following three recommendations:

1. The railway system should be refinanced.
2. Economies in operation should be adopted.
3. Revenues should be increased by improving service, principally by the purchase of 80 new street cars.

The Mayor added that she wished to confer with the chairmen of the finance and the utilities committees of the Council on refinancing of the lines. The Mayor was quoted as follows:

> Increasing revenues are a very necessary factor in solving the problem of even reasonable financial stability for the system. The only way to increase revenues is by speeding service and creating more express routes for the outlying districts.
>
> The way to do that is by buying the 80 new street cars. I feel like urging you to consummate this deal quickly if our interests can be quickly taken care of, bearing in mind that the proposed cars are a vital part of the new program for successful operation of the railway.

On Dec. 10 the city of Seattle cashed the payroll warrants of more than 2,000 railway employees. Two days before the payrolls were due the Clearing House had refused to cash the municipal railway warrants. Finally, Mayor Bertha K. Landes and members of the City Council arranged for a loan of the necessary funds from the city light department. It was found that the city light department has on hand about $1,200,000 in cash, and the water department fully half as much representing proceeds of bonds sold for construction work. By borrowing from the fund, it was pointed out, the railway is helped and the light department will profit, for the railway warrants bear 6 per cent interest. Before this plan was made public, the Mayor received an offer from Rhodes' department store to cash the $130,000 of railway warrants.

In a belated effort to meet the emergency, members of the City Council advanced two proposed plans for refinancing the railway. Of the two refinancing plans favored, one is to induce the Stone & Webster interests, from whom the railway was taken over, to grant an extension of time on the railway purchase bonds; the other is to issue long-term refunding bonds sufficient to pay off the present bonds. At the present time the city pays $833,000, annually on the principal. This sum with interest brings the payment to approximately $1,500,000. If the bondholders are willing to grant an extension of time, to permit a payment of not more than $500,000 annually, E. L. Blaine, chairman of the City Council finance committee, states the line could be made to pay.

If the refunding plan is attempted, the city must first go to the Legislature for authority to float such an issue. The city owes approximately $10,835,000 on the $15,000,000 purchase. It would be necessary, therefore, to issue $10,835,000 in refunding bonds to pay off the present outstanding bonds. The refunding bonds, so Mr. Blaine pointed out, would be on a 50-year basis.

LEGISLATIVE AUTHORITY NECESSARY

In the meantime the Council expects to adopt suggestions of D. W. Henderson, superintendent of the railway, that will further reduce operating expenses. The changes affect nearly every car line in the city and will result in an estimated annual saving of $300,000 in operating costs. The plan contemplates speeding up of service by rerouting lines through the downtown district to reduce congestion. The basic idea is to make street car riding more attractive by more frequent service, chiefly through the operation of loop cars during the early morning and late afternoon rush periods. Except in one or two minor instances, no curtailment of service is proposed. Unlike the plan proposed by Clark R. Jackson, superintendent of the public utilities department, Mr. Henderson's program does not call for looping back of all North End and Capitol Hill car lines at Pike Street. Mr. Henderson estimates that the saving in operating costs due to rerouting will be $156,364 a year, without any reduction in regular service.

Increased Rates in Petersburg Sought—Buses to Operate

The Virginia Electric & Power Company recently filed a petition with the State Corporation Commission for a general increase in transportation rates in the city of Petersburg, Va. The case has been set for a hearing on Dec. 21. It is stated in the petition that the company is planning to start the operation of buses in Petersburg on Jan. 1, 1927, in connection with its railway system. The company asks that the following fares become effective on that date over its railway and bus system in the Petersburg division: Cash fare, 7 cents; tokens, four for 25 cents; school tickets, 3½ cents. There will be no charge for transfers. Rates in force at present are: Cash fare, 6 cents; tokens, five for 25 cents, and school tickets, 2½ cents.

The company further declares that it plans to operate buses under an ordinance passed by the Petersburg City Council on Nov. 16 containing regulations for bus operation in that city. It also plans to replace railless cars on Sycamore Street with buses.

More Pay for Employees, Says Paper

The San Francisco *Chronicle* of recent date stated that the finance committee of the Board of Supervisors paved the way for an increase of 40 cents a day for clerks, car repairers, trackmen and janitors employed by the San Francisco Municipal Railways, San Francisco, Cal. This was accomplished by transferring $50,000 from the 1926-1927 budget to reimburse the city lines for funds borrowed to aid in constructing the Twin Peaks and Stockton Street tunnels. Chairman McSheehy pointed out that all of the $50,000 would not be used in meeting the proposed pay increases, but would guarantee the road against a deficit. Wages now received by the employees are as follows: Clerks, $185 a month; trackmen, $5.40 a day; car repairers, $6.40, and janitors, $145 a month. Several hundred will be affected by this change.

No Accident Bonus Plan Announced in New Jersey

As an additional incentive to careful driving on the part of car and bus operators, the Public Service Railway and the Public Service Transportation Company, Newark, N. J., on Dec. 3 put into effect a "No Accident Bonus Plan."

Under the plan $1 will be credited to each operator for every week of the fiscal year in which his accident record is "clear"; that is, in which no accidents are charged against him. The first bonus will be paid him in a lump sum on or about Dec. 15, 1927, and each year thereafter, so that it will provide a welcome Christmas fund. If the operator's record is clear for the entire fiscal year he will receive $60 instead of the $52, to which he would be entitled under the letter of the offer.

A continuing record for each reporting operator will be kept in every carhouse and garage from which cars and buses are operated. Especially constructed blackboards will be used for this purpose. They will carry the name of every operator reporting at that particular carhouse or garage. For every week of the current month in which he has had no accident a white star will be placed opposite the operator's name and a red dot, red to indicate danger, for every week in which one or more accidents are charged against him. A cumulative record of white stars, red dots and bonus earned will also be kept for every man.

In addition, at the expiration of the year, the name of every operator who has gone through the twelve months with no accidents will be permanently painted on the board, the list constituting the house or garage honor roll.

"L" Rent Put at $900,000

The proceedings before the Pennsylvania Public Service Commission on Dec. 10 on the matter of an "L" rental were adjourned by Commissioner Benn. Counsel for the Philadelphia Rapid Transit Company and protesting parties were instructed to file briefs and prepare to argue the case not later than February, 1927.

The outstanding testimony of the hearing was that of ex-Service Commissioner Scattergood, who stated that the Philadelphia Rapid Transit Company could operate the city-built Frankford elevated line at a substantial profit and still pay the city a flat rental of $900,000 a year during the 30-year term of the proposed lease. He based his analysis of the earning capacity of the Frankford road upon figures submitted by the company. He said that proper consideration of the increased earnings through short-haul traffic on surface lines in the northeast section, due to the elevated operation, would establish the city's line as a consistently profitable utility.

Coleman J. Joyce, chief of the Rapid Transit Company counsel, objected to Mr. Scattergood's testifying as an expert, but was overruled by Mr. Benn, who said that the witness was as fully conversant with utility matters as any man on the bench. At the conclusion of the hearing, the commission instructed W. K. Myers, president of the railway, to forward his estimates of the rentals due the city each year in the proposed lease. That exhibit, which the Philadelphia Rapid Transit Company officials declared would differ materially from the figures submitted by City Comptroller Hadley, will be open to rebuttal by the protesting parties.

Pittsburgh Trainmen Receive Increase of 1½ Cents an Hour

At its regular meeting on Dec. 7, the Pittsburgh Traction Conference Board approved the item in the Pittsburgh Railways budget for 1927 which included the increase of 1½ cents an hour in the rate of pay of trainmen, effective Jan. 1, 1927. The contract with the men does not expire until May 1, 1928. As was stated in the ELECTRIC RAILWAY JOURNAL of Dec. 11, page 1062, the increase is considered economically sound because of the many economies the men have instituted or helped to put into effect.

New Rates in Knoxville

The Tennessee Public Utilities Commission has approved a new schedule of rates on the lines of the Knoxville Power & Light Company, Knoxville, Tenn., effective Jan. 1. It provides for selling six tokens for 30 cents, a weekly pass good for any number of rides for $1.25 or 10 cents a ride for all who do not have tokens or passes.

Another Move in Jacksonville Franchise Issue

A tentative franchise for the Jacksonville Traction Company, Jacksonville, Fla., is to be prepared and submitted to the laws and rules committee of the City Council and the citizens' committee, from which a new bill of privilege is expected to be procured. This decision was made at a joint meeting of the two committees held in the City Hall on Nov. 30. A series of meetings is to be held, in which J. P. Ingle, manager of the company, will participate. It was his belief that the franchise, after it is prepared, should be submitted to the voters to decide. He announced that the company plans to spend $750,000 on extensions and improvements to the service if a proper franchise is granted by the city.

Radial Agreement Submitted

The draft agreement between Toronto and the Ontario Hydro Commission for the transfer to the former of the Hydro radials was submitted to the board of control by the City Solicitor on Dec. 1. Objection was taken by the board to one clause providing that any property of the Toronto & York Radial Railway, which is not being transferred by the agreement, be still in the name of the Toronto & York Radial Railway. The city will deliver to the commission such conveyances, transfers and bills of sale as may be necessary to vest in the commission all property not being transferred by the agreement and which shall then be in the name of the Toronto & York Radial Railway.

It was suggested that the foregoing clause be taken up with the commission to have the agreement before the City Council with the agreement transferring the property to the Toronto Transportation Commission.

The agreement states the original purchase price and the amount spent in rehabilitation of $2,375,000 and $1,200,000, respectively, but leaves blank the further amounts to be paid by the city. The commission will secure cancellation of the $1,200,000 bonds issued by that body, the city taking over the liability and leaving, finally, only $2,375,000 bonds for the purchase, issued by the commission for the redemption of which the city will be responsible. The commission will hold the city's bonds to this latter amount as security for payment. The commission will continue to supply power at rates charged to similar enterprises with an indemnification of the city against loss. A complete transfer is provided for and a single arbitrator will adjudicate on any disputes arising in the future.

Philadelphia Rapid Transit Within Its Rights

Much has been said in the newspapers of Philadelphia in the last ten days about the inadequacy of the service furnished by the Philadelphia Rapid Transit Company on its surface lines. One of the charges is that a deliberate effort is being made to promote the use of the more costly cabs at the expense of the trolley service. In consequence the *Ledger* has reminded its readers:

> In all consideration and discussion of transit service at this time of peak loads, due allowance must be made for the difficulties the company encounters during bad weather. It is admittedly hard to maintain schedules when ice and snow block the tracks.
>
> It must also be remembered that the traction company is within its rights in urging the use of its cabs. It is not within its rights if it is promoting the use of its taxicabs by curtailing car service at the expense of the regular car riders.
>
> The P. R. T. protests that this charge is both unfair and unfounded. Nevertheless, thousands of Philadelphians have the impression that it is true. It has been made for weeks by city and suburban car users. It should be the first business of the P. R. T. to eradicate that impression.

Traffic Jams May Require Rerouting

Rerouting cars of the Birmingham Electric Company as a means of eliminating congestion in the down-town district may become necessary in Birmingham, Ala., according to Ross W. Harris, traffic expert in charge of Birmingham's traffic survey. As a result of the recent rapid growth of the city the down-town streets are very badly congested. Mr. Harris will require a number of months in completing his survey and will then offer a solution.

Modified Franchise Recommended in Kansas City

The special franchise committee of the City Council of Kansas City, Mo., at a meeting held on Dec. 11, recommended a modified franchise, providing an income of $2,000,000, based on 8 per cent earnings on a valuation of $25,000,000. The modified franchise recommendation will be submitted to the Council immediately, although action probably will not be taken before Dec. 20. William G. Woolfolk, president of the new company, agreed in principle with the report, and representatives of the railway will act with the committee when a committee is chosen later to work on the actual draft of the franchise document.

The recommended franchise, which is for 30 years, provides that when the earnings of the company exceed 8 per cent, reductions are to be made in the ticket fare at the rate of ½ cent for each $100,000 gain in the net annual income. The fare at present is fifteen tickets for $1. An expenditure program of $6,600,000 is required, half in rehabilitation and half in new improvements and extension. An 8 per cent return will be allowed on the money spent for improvements.

It is recommended that the street railways in both Kansas Cities shall be operated as one system, including uniform and universal fares and transfers. The city will have two members on the company's board of directors instead of five, one of whom will be the city railway commissioner, who will have the power to determine what part of the expenditure shall be classified as repairs and what as improvements.

It has been pointed out by lawyers in Kansas City, Mo., that the proposed franchise is really not binding but is a "gentlemen's agreement," the Missouri Public Service Commission having the final control.

News Notes

Answers Filed in Fare Action.—Counsel representing the cities of Niagara Falls and North Tonawanda and the village of LaSalle has answered the equity action brought in the United States District Court at Buffalo by the International Railway, Buffalo, N. Y., seeking to restrain the municipalities through which it operates local and interurban lines from interfering with the collection of a proposed new tariff of higher fares. The action also names the New York Public Service Commission as one of the co-defendants. The three municipalities which have replied to the equity action deny the present rates are confiscatory. They also say the federal courts have no jurisdiction and that the fare question rests with the Public Service Commission.

Hears Fare Petitions.—Commissioner Van Voorhis of the Public Service Commission conducted a hearing on Dec. 15 on the petitions of the Black River Traction Company and its subsidiary, the Watertown Transportation Company for permission to increase fares in Watertown and to discontinue the sale of round-trip tickets between Watertown and Glen Park for 15 cents. Evidence was presented showing a loss of $12,996 in the operation of the traction company in 1925 and a profit of but $588 in bus operation and that about the same result was expected in 1926. The city of Watertown waived the fare restriction of the franchises granted these companies and on March 21, 1921, permitted a 7-cent fare. On March 15, 1926, application was made for an increase to 10 cents or seven tickets for 50 cents, which was granted Oct. 18, 1926, subject to the approval of the commission. There was no opposition to these petitions.

Campaign Urges Patrons to Buy Tickets.—The Georgia Railway & Power Company, Atlanta, Ga., is making a drive to induce patrons to buy tickets by the week. Through different advertising mediums it urges the purchase of a "dollar's worth" of convenience. Patrons are urged to hand the conductor a dollar bill and get fifteen car tickets in exchange, or, better still, to buy a week's supply from the street conductor or at any of Jacob's stores before boarding the car. In other advertising matter the company says: "Buy your week's supply of tickets and forget about fares for the rest of the week. It's budgeting street car expenses just like you budget the rest of the items in your daily life." It is hoped that this campaign on the "dollar's worth" tickets will result in material increases in sales.

Would End Skip-Stop System.—An effort is being made to have the City Council of Baltimore, Md., take part in a campaign being waged by some organizations and individuals to end the skip-stop system that has been placed in operation during the morning and evening rush hours by the United Railways & Electric Company. One of the members of the Council has introduced a resolution which requests the Maryland Public Service Commission to order the railway to discontinue this plan of operation. The resolution makes the claim that the skip-stop is "a great inconvenience to the general public and has done little to speed up traffic."

Wage Agreement Effected. — The Montreal & Southern Counties Railway, Montreal, Que., has concluded an agreement with its trainmen for three years, effective as from Sept. 1. Trainmen in passenger, baggage, express and work car service will receive 45 cents an hour for the first year; 49 cents for the second year; 50 cents for the third year and 52 cents for the fourth year. Conductors and motormen in freight and snow plow service will receive 50 cents for the first year; 52 cents for the second year; 54 cents for the third year and 55 cents for the fourth year. The rates were recommended in the majority report of the board of conciliation and investigation appointed to consider the dispute between the management and employees.

Elimination of "Death Crossing" Expected.—The elimination of "Death Crossing" on the Illinois Traction System west of Edwardsville, Ill., where eleven persons have lost their lives during the past four years, was brought a step nearer when a jury in the Madison County Court fixed an award of $1,500 as the amount to be paid the Tetherington estate for land needed by the Illinois Division of Highways to construct the southern approach to a viaduct to eliminate the grade crossing.

Higher Fares Increase Receipts.—Cash fares received on the Municipal Railways of St. Petersburg, Fla., on the first day of operation under the 7-cent rate showed an increase of approximately $240 over those on the last day of the 5-cent limit. No definite comparisons could be made, it was stated, until the 12,000 tokens sold at the old rate and now being used by patrons were returned. The total receipts of the municipal railways on the first day of the month, when the 7-cent fare went into effect were $1,070 in cash fares; $67 in token sales; $118 in school children's tickets and $175 in cash fares on the buses, in addition to transportation of 65 passengers on tokens and 204 school children.

Greetings and Party in New Brighton.—The Beaver Valley Traction Company is giving its Sixteenth Annual Christmas Party on Tuesday, Dec. 21, at Junction Park, New Brighton, Pa. On a Yuletide greeting card, the invitation is forwarded for a good time to be had from 7:30 to 1. A Christmas party in New Brighton is part of the tradition of the company.

Recent Bus Developments

Fare Readjustment Sought

New Jersey Company $1,600,000 Behind on Operation of Bus Subsidiary —Seeks Traffic Changes

Readjustment of fare zone limits on ten bus lines, five in Newark, calling for an additional fare where a city line is crossed, and a fare zone change on the Bloomfield trolley line are provided in a schedule filed on Dec. 15 by the Public Service Railway and Public Service Transportation Company, Newark, N. J., with the Board of Public Utility Commissioners to become effective on Jan. 1.

PRESIDENT MCCARTER STATES THE CASE

The petition is signed for both companies by Thomas N. McCarter, president. It declares that "the problem to be decided by the board representing the public and the companies is whether fares should be immediately increased sufficiently to make these properties self-supporting, or whether other measures should and will be undertaken either to make a fare increase unnecessary or to lessen the amount of any necessary increase in fare."

The readjustment of zones, with the attendant increase in fares to a considerable number of riders, is only one of several measures suggested by the companies for eliminating the financial troubles connected with the operation of the transportation system in the various sections of the State. These included a further and more completely co-ordinated service; relieving the company of paving obligations; relief from charges for snow removal, street sprinkling and oiling; better regulation of traffic; institution of a better type of bus service; a reduction of taxes.

Five of the lines are in Newark and five outside the city. On the Newark routes a 5-cent fare has been charged, regardless of the fact that the end of the line was beyond the city limits. Under the proposed rate a 5-cent fare would be collected from passengers riding to the city limits and an additional 5-cent fare from all those riding beyond. Other lines affected similarly are those between Elizabeth and Roselle and between Paterson and Hawthorne. On lines between North Newark and Passaic and between Elizabeth and Kenilworth the fare for through passengers would be increased from 10 to 15 cents.

RAILWAY TAX COLLECTOR FOR PUBLIC

A statement made by the companies says in part:

In New Jersey the railways are practically tax collectors for the public, the riders on the car paying the taxes. These companies pay a franchise tax of 5 per cent of their gross receipts. In addition, they pay local taxes on real estate and personal property, the railway paying a gross receipts tax at the average state rate in lieu of its tax on personal property. These, of course, are in addition to federal taxes. Such high taxes are not assessed against any business in the country other than utility companies. These two companies are paying taxes amounting to approximately $2,740,000 a year.

All passes and reduced rate tickets of every kind and description should be abolished. If the rates charged permitted the companies to earn the full cost of service, passes and reduced rate tickets might be favored on the ground of public policy. But while these companies are attempting to maintain the 5-cent fare, which experience has shown to be too low a fare to provide the full cost of the service, losses should not be increased by carrying a certain class of passengers at a still lower rate of fare or for nothing.

All the above measures are in the public interest but cannot be made effective without the assistance and co-operation of the public authorities. They must be effective before the public can obtain the benefit of a completely co-ordinated and unified system of local transportation. Their adoption furnishes the only hope of supplying the public proper and adequate service at the lowest rates of fare consistent with such service.

When the railway instituted the 5-cent fare experiment at the request of the board, the company had filed a 10-cent rate. A higher fare than at present obtains is justified by experience, not only here but generally throughout the United States. The fare on buses in New York City and Philadelphia is 10 cents. The railway fare in most other places throughout the country is higher than that charged by this company, the average throughout the country being 7.7 cents. In New York City where the fare is 5 cents, a substantial part of the cost of operation is provided through general taxation.

Attention is then called to the fact that since the inauguration of the 5-cent fare the railway has failed to pay operating expenses and fixed charges with no return upon the money invested in the railway company by Public Service Corporation of New Jersey, and that Public Service Transportation Company has failed to earn operating expenses and fixed charges during this same period by more than $1.600,000. "Neither the board nor the public can expect this state of affairs to continue," declares the petition.

Ordinance Would Protect Louisville Railway

A direct result of the announcement on Dec. 6 of the plans of the Peoples Transit Company to establish a bus line on Broadway, Louisville, Ky., in competition with the Louisville Railway has been the introduction of a regulatory ordinance before the City Council. This measure would bar buses and jitneys from streets containing car lines, or streets paralleling car lines for a distance of three blocks to each side, thus giving the traction company protection along its own line and closing adjoining property served by the line. The proposed new ordinance would also place restrictions on bus companies, regarding the amount of insurance, bond or similar protection that would have to be given the public, as protection against personal injury and property damage.

No action is expected on the ordinance until the latter part of the month. In the meantime it is understood that the new bus company is getting ready to start service directly. The new line is to use Mack buses, at least on its first unit installations.

Twin City Operation Explained

President Lowry Tells the Story of Co-ordinated Service Before Local Real Estate Board

Street cars will never be superseded by bus lines, says Horace Lowry, president of the Twin City Rapid Transit Company. He was speaking before the Minneapolis Real Estate Board, Minneapolis, Minn., on Dec. 9 in the first official review of the operation of railway and bus lines by the Minneapolis Street Raliway and the Twin City Motor Bus Company. This last-mentioned company, an auxiliary, has two crosstown bus lines connecting intersecting trolley lines on Lowry Avenue and 38th Street and a gas-electric bus line supplementing trolley service on Nicollet and Hennepin Avenues.

Mr. Lowry said that the present rate of railway fares in the city yields just about the 7½ per cent return authorized by the Minnesota Railroad and Warehouse Commission. These rates of fare, 8 cents cash and six tokens for 40 cents, amount to an increase of 13 per cent over the old rate, which was 6 cents flat. On the other hand, passenger traffic has decreased 8 per cent, but fewer automobiles are entering the heart of the city than a year ago.

The bus lines have been operating only a few weeks. The gas-electric line does not compete with the railway. It is showing a profit at a 10-cent fare. Receipts of the crosstown bus lines, run at the same fare as the trolleys with transfers, are not yet up to operation cost. The gas-electric line, without transfers, is taking in about 38 cents a bus-mile on an operating cost of about 25 cents. The crosstown lines are operating at about the same cost, the Lowry Avenue line returning 13.1 cents a bus-mile and the 38th Street line 20 cents.

In Minneapolis the street cars bulk about 18 per cent of the vehicular traffic but carry 76 per cent of the travelers.

In prospect for 1927 is a line across the new Ford bridge connecting the two cities over the Mississippi River and two car lines now reaching to the bridge in either city. Eventually there will be another crosstown line on 42nd Street, the farthest south now being Lake Street.

Proposed bus service for what is known as the Bryn Mawr line extension into a part of the city now being developed seems remote as the park board desires to collect a fee for the use of the parkways to compensate for the additional burden on the roadways from operation of buses. Mr. Lowry said this had been found impractical by the state commission as it would permit any town to levy taxes on buses passing through and would upset the entire state rate structure in the present system of state licensing of buses

Bus Lines Authorized.—The Public Service Commission granted a certificate on Dec. 14 for the operation of bus lines in the city of Rochester and the town of Gates, Monroe County, to the Rochester Railways Co-ordinated Bus Lines, Inc.

Another Bus Proposal for Buffalo

Ernest M. Howe of Detroit, whose 5-cent bus plan in Buffalo collapsed last spring, has outlined to Mayor Frank X. Schwab a proposal for the operation of a fleet of 25 buses in Buffalo over three lines at an 8-cent fare. In his statement giving publicity to the new Howe bus proposal, Mayor Frank X. Schwab of Buffalo said that the American Car & Foundry Company had notified him that it would finance the new bus lines in Buffalo for Howe and his associates, who will operate under the name of the Buffalo Bus Corporation.

Sufficient capital to start the operation of 25 buses on three lines in Buffalo has been secured and Mr. Howe and his associates have indicated their willingness to post a bond of $25,000 to insure the city that they will carry out every detail of the new plan to operate buses in competition with the local lines of the International Bus Corporation, a subsidiary of the International Railway, both of which are under Mitten Management of Philadelphia.

Application will be made to the City Council by Mr. Howe and his associates for a franchise on the three proposed lines and then the application will be taken before the Public Service Commission for the necessary approval. One of the largest makers of buses, it was stated by Mayor Schwab, will lend its financial support to the Howe plan and will appear before the state utilities board in support of the 8-cent bus lines. The International Bus Corporation charges a 10-cent fare on its three local lines in Buffalo.

Bus Plans for Suburban New York Maturing

The County Transportation Company, Inc., Port Chester, N. Y., petitioned the Public Service Commission on Dec. 10 for a certificate for the operation of bus lines in the village of Port Chester and the town of Rye, Westchester County. The routes indicated are from Liberty Square to North Main Street, Putnam Avenue, North Regent Street, Irving Avenue, Breckenridge Avenue, Fairview Avenue, Monroe Place and Westchester Avenue, returning to Liberty Square and also from Liberty Square to Westchester Avenue, South Regent Street, Boston Post Road and South Main Street to Liberty Square.

Negotiations have been under way for some time between the trustees of the village of Port Chester and the railroad as to the operation of railway and bus lines and public hearings were held on Nov. 1, 9 and 15. As a result the board of trustees adopted a resolution on Nov. 15 consenting to the abandonment of railway lines and the substitution of buses therefore. The resolution provides in addition for an annual payment to the village of 3 per cent of the gross receipts of the entire routes, that operations will begin within 60 days after a certificate has been granted; that present equipment is to be removed from the streets; that the fares will never exceed 10 cents with transfer privileges, and that the franchise will be for ten years from the date of certificate issued by the Public Service Commission.

The County Transportation Company, Inc., also filed a petition with the commission for authority to issue 250 shares of its capital stock of the aggregate par value of $25,000 and petition was also made by the New York & Stamford Railway for authority to purchase the Transportation Company stock and to pledge it as collateral security. Hearings will be held on the three petitions.

Transfers with Railway Suggested in St. Louis

The People's Motorbus Company of St. Louis, Mo., through its attorney, Robert Burkham, on Dec. 2, offered to work out with the United Railways a plan for interchange of transfers from the Kingshighway route of the bus company to and from the various street car lines connecting with it. The offer was made at a meeting of the rapid transit committee of the Board of Aldermen. It meets a suggestion contained in the Rapid Transit Survey recently made public by E. R. Kinsey, president of the Board of Public Service, and C. E. Smith, consulting engineer for St. Louis. Mr. Smith, who favors co-ordination of bus and street car service, declared the suggestion if adopted would be "one of the most important events in the transportation history of St. Louis."

Col. Albert T. Perkins, general manager of the United Railways, has declined to comment on the suggestion until he has had an opportunity to study it. The United Railways is in receivership and under the rules of the federal court, which has jurisdiction, the receiver is not permitted to accept less than the regular fare fixed by the Missouri Public Service Commission. The present car fare is 7 cents, while the bus company charges 10 cents. Under a split fare plan the bus company would have to accept 3 cents as its share of co-ordinated service unless the federal court should approve some other division.

East St. Louis Railway Buys Business—Ends Dispute

Sale of three of the four buses operated by the Herzog Motor Transport Corporation of Edwardsville, Ill., to the East St. Louis & Suburban Railway, East St. Louis, has been announced. Until recently the Herzog line operated the buses between Edwardsville and Glen Carbon, but was enjoined by the Circuit Court from further operations on complaint of the railway. The bus company had failed to obtain a certificate of convenience and necessity from the Illinois Commerce Commission, although the bus line was several years old. The sale of the buses is believed to have ended the dispute. The railway proposes to operate a bus line between the two towns, while F. W. Herzog, president of the motor corporation, will charter his single remaining bus to special parties, without a fixed schedule. He does not need a state certificate to use a bus in that manner.

Another Promise on New York Bus Matter

Mayor Walker of New York said on Dec. 13 at a meeting of the Board of Estimate that he expected the board to agree on the award of bus franchises, 116 applications for which are pending, not later than Jan. 15. The Mayor explained afterward that he had meant that the board by that time would agree not only on a policy as to whether bus operation should be borough-wide or city-wide, but also on the applicant or applicants to whom the franchises would be awarded.

According to one commentator the Mayor's announcement was interpreted at City Hall as indicating that there had been at least a tentative agreement between the Mayor, who has favored city-wide operation, and Comptroller Berry and most of the borough presidents, who are believed to have favored making separate awards for each borough.

Express Service Between Oakland and Berkeley

Express railway service between Oakland and Berkeley via Telegraph Avenue, supplemented by the operation of buses, which will make all stops, was set by the Key System Transit Company for Jan. 3 following receipt of word that its fleet of fourteen new buses would be ready for operation at that time. The new service will reduce by 25 per cent the present running time between Fourteenth Street, Oakland, and University Avenue, Berkeley.

The fare will be 7 cents while universal transfers will be issued to all crosstown lines, and from the buses to the street cars and from street cars to buses. A person can board a bus at any corner and transfer to the through street car line or any crosstown line, or can board a through car and transfer to the bus if he wants to alight at any street between the station stops of the through street cars. Buses will not operate on Sunday, and on that day the present street car service will be maintained.

New Coach Service Begun in Atlanta

Atlanta's ten new single-deck coaches were placed in operation on Dec. 1 on the Morningside and Virginia-Highland lines. They are equipped with every modern safety device and appliance to improve riding comfort. These include four-wheel hydraulic brakes, 7½-in. balloon tires, deep, leather-upholstered seats, ample ventilation facilities, tested heating systems and adequate lighting arrangements. Like the double-deck coaches placed in service last year, the new coaches are painted in a flamingo red and cream color scheme. Entrance and exit are by the front door, which is operated mechanically by the coach driver. The single-deck coaches do not replace the double-deckers, as the larger coaches will continue in service during the rush hours, but simply are providing a supplementary service which already is proving very valuable to patrons of both lines.

Financial and Corporate

New Financing for Brooklyn City Approved

The stockholders of the Brooklyn City Railroad, Brooklyn, N. Y., approved on Dec. 7 a plan to create a new general and refunding mortgage of unlimited amount and the issuance of $2,500,000 of the bonds at the present time. As first drawn the plan contemplated the use of stock purchase warrant in connection with the bonds, but the bonds will be sold without the stock purchase warrant. Under the terms of the resolution adopted up to $18,000,000 of bonds may be issued for general and refunding purposes on the present properties. Any further issue of bonds, however, must be secured by new properties.

Directors are empowered to issue bonds from time to time without the stockholders' consent and to give stock purchase warrants or make future bond issues convertible into stock. No action was taken on the plan to increase the capital stock. This remains at $16,000,000. Funds received from the sale of the present issue of $2,500,000 will be used, it is said, for the purchase of cars, the redemption of car trust certificates and other corporate purposes.

New Firm to Deal in Utility Securities

Stone & Webster, Inc., and Blodget & Company announce the formation of a new company under the name of Stone & Webster and Blodget, Inc. The corporation is a combination of the securities department of Stone & Webster, Inc., and the old investment house of Blodget & Company. The engineering and construction, management and investigating departments of Stone & Webster, Inc., are not included and will not be affected by the combination.

Bayard F. Pope, now a partner of Blodget & Company, will be president of the new corporation. Other officers and the directors will be drawn from both the participating companies, all the present partners of Blodget & Company being officers of Stone & Webster and Blodget, Inc.

Public utilities and others whose securities will be handled by Stone & Webster and Blodget, Inc., will have the advantage of a wider market through the combination than either of the companies could offer separately. Its facilities will be available not only for originating issues to be sold by the new house exclusively, but also to public utilities and other corporations in the sale of whose securities Stone & Webster and Blodget, Inc., will participate with other houses.

While the new corporation will be operated in an entirely independent capacity, it will have at its elbow the comprehensive engineering and construction and analysis service of Stone & Webster, Inc.

The officers of Stone & Webster and Blodget, Inc., in addition to Bayard F. Pope, president, will be: C. E. Ober, H. R. Hayes and R. H. Carleton, senior vice-president; T. T. Whitney, Jr., P. L. Warren, J. D. Thomas, R. H. van Deusen, A. C. Dunmore, J. E. Baker and A. B. Griffin, vice-presidents; F. T. Pratt, secretary, and Howard F. Neill, treasurer.

The new company will begin operation on Jan. 1, 1927, at 120 Broadway, New York.

New Chicago "L" Issue Approved

Stockholders of the Chicago Rapid Transit Company, the elevated lines, on Dec. 9 approved an increase in the authorized prior preferred stock of the company from $5,000,000 to $10,000,000. The new issue of stock has been approved by the Illinois Commerce Commission. It is the intention of the directors to issue only $1,500,000 at this time, to be sold through the Utility Securities Company. The new stock will pay a return of 7.2 per cent or 60 cents a share a month, instead of the 65 cents a month a share being paid on the present outstanding prior preferred, sold several years ago to employees and the public. In a notice sent with the latest dividend check to its passenger and employee partners the management said:

> The lower rate of return of the new stock emphasizes the value of the present outstanding stock as an investment. The present stockholders should hold on to their holdings, because they will find it difficult to get an investment as reliable which pays as high a rate of return. The new rate of 7.2 per cent is a good return on a stock that is as safe as the prior preferred of the Rapid Transit Company. Shareholders who desire to increase their holding may make application now for the new stock to the Utility Securities Company.

The proceeds of the new issue of stock are to be used to meet capital expenditures for improvements and extensions to permit of the company doing a larger business. The money derived from the last stock sale was used for the purchase of new cars, for platform extensions and other capital expenditures which greatly enhanced the value of the properties.

$4,656,000 Boston Elevated Issues Authorized

The Department of Public Utilities of Massachusetts has approved issuance by the Boston Elevated Railway two issues of bonds. The first totals $2,700,000 to be put out on Feb. 1, 1927, at not more than 5 per cent or not longer than twenty years to refund West End Street Railway bonds maturing on that date. The second totals $1,956,000 for the same period and with the same interest rate to be put out May 1, 1927, to retire the same amount of West End Street Railway bonds maturing then. The indentures by which these two issues will be secured will carry the provision for calling the bonds at 101 after the expiration of two years from the date on which they are drawn.

Another Hearing on Albany Fares

In figures submitted by the United Traction Company, Albany, N. Y., at the Nov. 30 hearing before the Public Service Commission on the petition of the company for a 10-cent fare it was brought out that the company had a net operating income of $261,955 on its entire system for the nine months of 1926. Operating losses of $21,552 in Troy and $2,173 in Rensselaer were claimed by the company. General Manager Murphy said that the net operating revenue of $222,496 shown in the comparative figures for Albany was virtually eliminated when fixed charges were deducted.

An adjournment was taken until Dec. 15 to enable the commission and city authorities to go over the data. John E. MacLean, general counsel of the company, said he would submit figures on behalf of the Capitol District Transportation Corporation separately, although the problems of the bus and trolley lines were much the same. The Capitol District Transportation Corporation, the bus operating subsidiary, has a similar petition pending.

Immense Refunding Issue by Indiana Company

Retirement of seventeen issues of securities, varying in amount from $11,000 to $1,834,300, by the Interstate Public Service Company, Indianapolis, Ind., will be effected through an issue of $10,000,000 of first mortgage and refunding 5 per cent bonds which the company has sold to a banking syndicate. Nine of the issues which are being retired carry a 5 per cent interest coupon, one 5½ per cent, five 6 per cent, one 6½ per cent and one 7½ per cent.

In addition to providing for the retirement of these bonds, proceeds of the new issue will be used for additions and extensions to the property of the corporation, which is controlled by the Middle West Utilities Company.

Balance in Detroit Increases

For the year ended Nov. 30, 1926, the City of Detroit, Department of Street Railways reported railway operating revenue of $22,788,523 against $22,246,735 for a similar period of the year previous. The coach operating revenue was $2,023,802 and $702,596 for this year and last year respectively. The total revenue from all sources was $25,075,554 against $23,132,562 for the year ended Nov. 30, 1925. Total operating expenses were $19,142,015 against $17,060,802. In these two figures are included coach operating expenses of $1,959,592 and $673,299 for the years ended Nov. 30, 1926, and Nov. 30, 1925. Net revenue was $5,933,539 against $6,071,670 in November, 1925. The net income was $3,243,243 for this year compared with $3,440,529 for a year ago. The balance for the period was $638,063 against $562,741 for a similar period last year. Railway passengers carried in 1926 totaled 489,726,807 and 477,412,178 in 1925. The total number of passengers carried on the coaches was 25,804,419 this year against 9,435,872 for the year ended Nov. 30, 1925.

Receivers Named for Chicago Railways

Friendly Action Brought to Preserve Integrity of Company and Avoid Chaos and Confusion—Statement by Directors—Other Recent Moves Reviewed

THE Chicago Railways, the so-called west and north side surface lines, were placed in receivership on Dec. 15 by Federal Judge John H. Wilkerson. The petition for this action came from the Westinghouse Electric & Manufacturing Company, which represented that it had demanded $67,075 in payment for electrical equipment for a substation and that payment had been refused. It asserted also that the funded debt of the company, totaling $103,228,265, will fall due when the company's franchise expires on Feb. 1, 1927, and that this obligation cannot be met. To conserve the interests of every one it was urged that the company and all its assets and earning power be put into judicial custody. The Chicago Railways, operating in coordination with the Chicago City Railway, constitutes the Chicago Surface Lines.

The company through its lawyers admitted all the allegations and Judge Wilkerson appointed these three receivers: John J. Mitchell of the Illinois Trust Company, Frederick H. Rawson of the Union Trust Company and Henry A. Blair, president of the company.

The court authorized the lines placed under its protection to continue unified operation with the "city" system. This means the same service as at present with transfers and the same fares. For several years Chicago's Surface Lines have been charging a 7-cent fare. On the elevated lines the fare is 10 cents.

Protection of Law Needed

In explaining the reasons for the receivership the directors of the Chicago Railways pointed out that the only way in which the company can provide for the obligations which will become due on Feb. 1 is the continued operation of the system and that the only way this can be assured is by placing the company's property under judicial protection.

No arrangement with the city for continuance of service after the expiration of the franchises could be carried out, it is declared, if the holders of overdue bonds should bring suits, obtain judgments and issue executions against the property.

"Seeing no way," the statement of the board of directors says, "by which to avoid the chaos and confusion which would result in local transportation if the properties were not in judicial custody when the many millions of indebtedness evidenced by bonds falls due on Feb. 1—in other words, believing a receivership to be inevitable in order to give authoritative assurance that efficient street car service can be provided—the directors authorized and directed counsel for the company to join in the application that the court take the properties into judicial custody to the end that the system may be kept intact and thus able to provide service to the car riders without interruption."

John J. Mitchell of the Illinois Merchants' Trust Company, speaking for the receivers, said:

"In accepting appointment as one of the receivers it is with the hope that the receivers may be able to render a public service by bringing about between now and Feb. 1 concurrence among all interests in all street railway properties in some plan or arrangement which the city authorities might approve whereby for some reasonable period following Feb. 1, 1927, and without prejudice to any right of the city or to any interests in any of the properties, there may be continued the unified operation of all the surface lines with like effect as regards service to the public as though all such lines were owned and operated by one company.

"With the present unified service assured until Feb. 1 the immediate task of the receivers will be to work out if possible some plan, arrangement or understanding for the continuance after Feb. 1 of unified operation of the separate street railway properties in such a way that the city authorities may assent thereto without in any way prejudicing any of the rights of the city during the interval until a permanent solution of the traction problem is reached."

City Council Authorizes Six-Month Franchise Extension

An hour after the receivers had been appointed the City Council voted to authorize its local transportation committee to negotiate a six-month extension of the franchises of the railways. So many questions of a legal character were asked by the Aldermen that Mayor Dever said:

> This is a critical situation. I have practiced law long enough to know that this is the time to ask the corporation counsel to think—not to talk. I hope you will not ask questions involving complicated legal questions, but rather confine your questions to those which are essential for you to get information upon which to cast your votes.

Aldermanic questions indicated that the Councilmen desire the law department to ask the federal court to compel the receivers to continue to pay 55 per cent of the railway's net receipts to the city, pave its right-of-way as the franchise stipulates, clean the streets and perform other obligations which it assumed in accepting the franchise.

Later in the week the Mayor charged that the receivership was part of a plot to defeat Chicago's administration plan to unify local transportation facilities and give the citizens a fair traction deal. He made this statement at a meeting of the Conference on Home Rule for Public Utilities called by the Illinois municipalities.

While the Mayor was speaking Leonard A. Busby, president of the Chicago City Railway, in a letter to Alderman McDonough, chairman of the committee on local transportation, announced that his company would accept a six months extension of the present traction ordinance, which expires on Feb. 1, 1927.

Corporation Counsel Busch promised the Council sub-committee on traction that on Monday or Tuesday he would file an intervening petition in the federal court to assure full protection of the city's rights in the receivership under the 1907 traction franchise ordinances.

A very brief recapitulation of some of the salient points in the local traction situation follows:

1. Franchises of companies whose properties are operated by the Chicago Surface Lines, largest street railway system in the world, expire on Feb. 1. These companies are earning a good margin of profit, but one of them has already gone into the hands of receivers.

2. Bankers interested in Surface Lines' securities have formed protective committees for practically all classes of security holders, and seem disposed to await events on and after Feb. 1 before taking further action.

3. F. J. Lisman, New York, has submitted a plan for refinancing of the Surface Lines' properties which has met with the opposition of the protective committees.

4. Chicago Motor Coach Company has offered to replace street cars with buses, which raises the question of what will be done in that event with the present properties and their security holders.

5. The City Council has made several attempts to deal with the problem, which thus far have come to nothing, apparently because of the gap between ideas as to what is financially and what is politically advisable. A proposal that expiring franchises be extended six months is still under consideration.

6. The State Legislature does not meet in time to deal adequately with its part of the problem. Chicago will probably present little opposition to a bill permitting the granting of terminable franchises to the railways, but will undoubtedly object to state control thereof, especially in matters of service.

7. Chicago has at present an uncoordinated local transportation system composed of surface lines, elevated railroad and buses. Co-ordination of these facilities, with the possible construction of a loop subway, would greatly aid the development of the city and its metropolitan district.

Praise from a Financial Authority

THE bankers who have been identified with the Chicago Surface Lines for twenty years have formulated no plan for reorganization. With the earning power of the properties great as it is there should then be no difficulty in arriving at a sound financial plan. The Chicago Surface Lines are almost unique among street railways in the steady growth of their earnings. They carry annually about 850,000,000 passengers. The increase in passengers carried and in gross revenues this year is running better than 4 per cent above 1925.

Physically the property is exceptionally fine, it gives good service and has a substantial degree of public good will. The companies have been successful in obtaining reasonably remunerative fares from the courts, the value of their properties has been established beyond possibility of question. Even the city's appraisers have found actual value in excess of the "purchase price" established by the present ordinance. During the present régime millions of dollars have been collected in depreciation funds to meet heavy renewals that may be necessary some years hence.—*Barrons.*

Merger Talk Again in Washington

The Public Utilities Commission of the District of Columbia has adopted the bill designed to induce the Washington Railway & Electric Company and the Capitol Traction Company to merge voluntarily. Enactment of the measure will be sought at the coming session of Congress.

Stripped of its verbiage, the measure contains three rewards for the companies if they consolidate and a heavy penalty in the form of a 50 per cent increase in the gross revenue tax if they fail to do so by July 1, 1928. The rewards are a guaranty against unlimited bus competition, repeal of the crossing policeman tax and repeal of the bridge repair tax.

Members of the committee explained that the bill is very similar to the joint proposals of the railways submitted several days ago, except that the objectionable service-at-cost plan, based on an agreed valuation, is removed. The commission bill also ignored the request of the companies that they be relieved from any obligation to pay the cost incident to the laying of new pavements for the permanent improvement of streets or highways utilized by them.

The commission decided to transmit the outline of the merger plan submitted by the railways to Congress, together with its merger bill, so that it may have independent consideration.

Acquisition of the Washington Rapid Transit Company by the North American Company was a violation of the public utilities act, William McK. Clayton, special legal adviser to the Public Utilities Commission, held in an opinion submitted to the commission. Mr. Clayton held that no other utility in the District and under the control of the commission offended the act of Congress by acquiring and holding the stocks and bonds of another public utility corporation without first securing the consent and validation of either Congress or the commission to such purchase and holding. Mr. Clayton warned the commission that should a merger of the street railway companies fail to be consummated "a very grave question" might arise as to the legality of the holdings of the North American Company in the Washington Railway & Electric Company and the Capital Traction Company.

The purchase of the Washington Rapid Transit by the North American Company, Mr. Clayton said, "seems to be the first instance" in the commission's fourteen years of control "where a public utility submitting to its jurisdiction desiring to buy or sell the stock or bonds of another public utility did not first apply for the consent of the commission to such purchase or sale."

Abandonments in Oswego Sought

Five petitions were filed with the Public Service Commission on Dec. 9 by the Empire State Railroad Corporation asking for approval of the abandonment of certain railway lines in the city of Oswego, N. Y. The petition states the directors of the railroad adopted a resolution on Oct. 26 in favor of the abandonment of the railway on five different lines and that this resolution was adopted in a stockholders' meeting on Dec. 3. The petition further stated that the receipts from the electric lines on these routes did not meet operating expenses. This loss in conjunction with losses upon other routes in the city of Oswego was so great as to impair the solvency of the petitioner and threatened to destroy its ability to furnish railroad service of any kind over any of its lines. The commission will hold a public hearing on the application.

Long Receivership to Be Lifted

Property of Second Avenue Railroad, New York, to Be Sold Jan. 13—Reorganization Terms Reviewed

A plan to bring the Second Avenue Railroad, New York, out of receivership was made public on Dec. 15 by the committee representing holders of the road's receivers' certificates. It is proposed to buy the road at auction on Jan. 13 and then to form two corporations to control severally the real estate and railway properties of the company.

The proposed real estate corporation would have a bonded indebtedness not to exceed $750,000 secured by a first mortgage on the carhouse property and a capital issue of 31,400 shares of no-par stock. This lien would be placed on the land and improvements only to the extent necessary to meet cash requirements in the event that such funds were not provided by the consolidated mortgage bondholders. The stock would be exchanged for receivers' certificates in the ratio of ten shares for each $1,000 certificate.

The proceeds of the first mortgage loan, if placed on the property, would be used to the extent necessary to purchase an amount of the proposed railway corporation's first lien 6 per cent thirty-year bonds to provide cash for the latter corporation's operation. If the committee was able to bid in the road at a price within the amount of the certificates found to have been expended in preserving and operating the road, the amount of the first mortgage loan would be confined to cash requirements. The statement says:

> The committee has been conferring with representatives of the consolidated mortgage bondholders on sundry proposals looking to the providing by them of the "cash requirements" in exchange for an interest in the railway corporation. This would save the carhouse property for the certificate holders free from lien. The principal obstacle has been the difficulty of arranging a contract to obtain power for operation. There is still a possibility that the consolidated mortgage bondholders will provide said "cash requirements."

The proposed railway corporation would acquire the property, rights, interests and franchises, exclusive of real estate. It would have a bonded indebtedness not to exceed $750,000 of first lien 6 per cent 30-year bonds, and a capitalization of 31,400 shares of no-par stock. This stock would be exchanged ten for one for certificates in the event that cash requirements were met by a mortgage on the real estate. However, if they are met by bondholders, this stock would be divided between bondholders and certificate holders in amounts to be determined by the committee.

The Second Avenue Railroad operates 26 miles of conduit railway in the Borough of Manhattan. The road has been in the hands of receivers since 1908. This is one of the longest receiverships on record.

Helena Properties Sold

Properties of the Helena Railway, Light & Power Company, Helena, Mont., were sold on Dec. 1 for $584,500, under foreclosure proceedings, to the bondholders' committee, represented by C. M. Clay of the law firm of Simpson, Thayer & Bartlett of New York.

The plan proposed for the reorganization contemplates the segregation of the railway properties from the light properties. Two separate companies will be formed, one to take over the railway and the other to take over all of the activities of the company other than those performed by the railway. Holders of certificates of deposit under the agreement dated July 30, 1925, who assent to the plan will receive for each $1,000 bond $600 in 6 per cent bonds of the electric company and $400 in cash, together with an amount of cash equivalent to interest at the rate of 5 per cent per annum upon 60 per cent of the principal amount of the old bonds from Sept. 1, 1925, to the date from which the new bonds bear interest and upon 40 per cent of the principal amount of the old bonds from Sept. 1, 1925, to the date to be selected by the committee for the distribution of the new bonds and cash to the holders of the certificates of deposit.

The electric company is to make an issue of 25-year 6 per cent bonds to be issued under and be secured by a mortgage constituting a first lien upon all physical assets and franchises of the electric company then owned and thereafter acquired and also upon the stock of the railway. The initial issue of bonds is to be $750,000.

Another Step in Disposition of Rockford Properties

Charles J. Horn, Milwaukee, Wis., bought the physical properties of the Rockford, Beloit & Janesville Electric Railway, Rockford, Ill., at a foreclosure sale on Dec. 9 in that city for $52,000. Mr. Horn was the only bidder. He bid in the property according to an arrangement under which it is expected T. M. Ellis, Jr., Beloit, will become the owner of the line within 60 days. The present sale relates particularly to the Rockford, Beloit & Janesville Electric Railway, formerly included as a part of the Rockford & Interurban Railway system.

Napa Valley Road Reported Sold

Rumor persists of the sale of the San Francisco, Napa & Calistoga Railway (electric) to the Western Pacific Company. The rumor has been strengthened by the reported sale of the Sacramento Short Line to the Western Pacific. It is generally known that the Napa Valley road has recently defaulted in interest payments on its

Digitized by Google

bonds. Control of the road is held by James Irvine, Seattle. Its tracks connect Vallejo with Calistoga, and it reaches San Francisco through a traffic agreement with the Monticello Steamship Company.

New York City Companies Would Consolidate

A joint petition of the Eighth Avenue Railroad and Ninth Avenue Railroad, New York, has been presented to the Transit Commission praying that the commission authorize the petitioners to merge and consolidate the capital stock, franchises and property of each petitioner pursuant to a joint agreement duly entered into by them, so as to form one corporation under the name of "Eighth & Ninth Avenues Railway."

States Condition of Former Railway Property.—The Denver & South Platte Railway, which until last May operated tramcars between Littleton and Englewood, Col., recently advised that all physical property had been removed from the right-of-way and sold in accordance with authorization from the Public Utilities Commission.

Worcester, Too, Accepts New Haven Control.—The committee on streets of Worcester, Mass., formally accepted the ruling of the 1926 Legislature that the New York, New Haven & Hartford Railroad be permitted to resume control of the Worcester Consolidated Street Railway. The matter was taken up to answer a petition of the New Haven road to the City Council that it be allowed to take over and control the holdings in accordance with the wishes of the city. The City Council and Mayor O'Hara favor the arrangement.

Opportunity Given to Buy Shares.—An opportunity is afforded the patrons and employees of the Winnipeg Electric Company, Winnipeg, Canada, to become partners of and share in the earnings of the railway. The company is offering 2,500 shares of its 7 per cent cumulative preference stock. The shares are offered to company employees at par, $100 per share, and may be bought for cash or on partial payments of $10 cash and $10 per month per share. In order to give a large number of customers and employees the opportunity to participate, the company is limiting the number of shares to any one person to 50. The sale will close on Dec. 23.

Approval Sought for Intercompany Financing.—The San Francisco-Sacramento Railroad, Oakland, Cal., has applied to the Railroad Commission for authority to execute a mortgage in favor of the Sacramento Northern Railway in the sum of $98,430. This will be payable in one year from date, with interest at 6 per cent, covering money borrowed from the mortgagee.

O. H. Wathen a Louisville Director.—O. H. Wathen has been elected a director of the Louisville Railway, Louisville, Ky. Mr. Wathen will replace W. S. Campbell, chief engineer and general manager of the Kentucky & Indiana Terminal Railroad, who resigned.

Personal Items

C. W. Wilson Research Manager

Pittsburgh Railways Designates Official to Head Important Activities —Many Years Experience

Clyde W. Wilson has been appointed by the Pittsburgh Railways, Pittsburgh, Pa., to the position of manager of the research department—a department which has been lately created for the purpose of rendering a service to the operating officials in the way of instruction concerning production and sales of railway transportation in other cities as well as complete and up-to-date information about all branches of the properties of the Pittsburgh Railways.

At the time of the reorganization of the company at Pittsburgh, Mr. Wilson was made assistant to the general manager and served in this capacity and as assistant to the vice-president until his appointment to head of the research department.

C. W. Wilson

The choice of Mr. Wilson for this position is particularly fortunate, his wealth of knowledge gained through years of experience both in electric railway and railroad transportation having fitted him thoroughly for this work.

The activities of his department range from investigations which may be so important as to indicate broad changes in policy or method to minute analyses of local operating cost. Information is secured by means of visits by the research manager and research engineer to other properties, through contact with associations, from trade journals, by maintaining a newspaper clipping service, from other companies direct, and from any other sources available.

Mr. Wilson was born near Covington, Ky., and was educated in the public schools and at Kentucky State College at Lexington. From 1902 until 1906 he worked for the Erie Railroad, the Cincinnati, Hamilton & Dayton, now part of the B. & O., and Chicago, Cincinnati & Louisville Railroad, now part of the Chesapeake & Ohio Railroad.

In 1906 he became associated with the Cincinnati Traction Company and served in various positions of the operating department until 1920, when he was asked to come to Pittsburgh to help Thomas Fitzgerald, at that time a consulting electric railway engineer and now vice-president of the company, in the work preliminary to the reorganization of the Pittsburgh Railways.

Changes in Personnel at Ludington

The Michigan United Light & Power Company, Grand Rapids, Mich., announces changes in personnel made since the recent formation of the Pitkin power group in Michigan. Under the new plan W. A. Wadsworth, manager of the southern territory since last March, has been made vice-president and general manager to direct the Michigan properties of the concern. His headquarters will be temporarily in Ludington, Mich., that he may supervise the management of the Ludington district.

Management of the Michigan Public Service Company at Sheboygan will be in charge of F. A. Swanson, Ludington, who will be succeeded as local superintendent by F. B. Swanson at Hart. C. L. Mosher will be plant engineer and load dispatcher for the state. He formerly was with the Consumers Power company at Jackson. C. G. Pitkin has been promoted from the Hart office to Ludington. Work in connection with the accounting and the construction activities of the company will be consoliated.

B. F. Pope Heads New Investment Firm

Bayard F. Pope has been elected president of Stone & Webster and Blodget, Inc., which will succeed on Jan. 1 to the securities department of Stone & Webster, Inc., and the investment house of Blodget & Company, as noted elsewhere in this issue. Mr. Pope has risen steadily in the investment banking field. After he was graduated from Harvard in 1908, he joined the Chicago banking house of Mason, Lewis & Company. This corporation was dissolved in 1910 and Mr. Pope joined Blodget & Company, by which he was charged with the responsibility of developing the New York office. Shortly after this country's entry into the war he enlisted for work in the publicity department of the Liberty Loan Committee, where, under Gov. Benjamin Strong, he did remarkable work as vice-director of publicity in charge of advertising, his department laying out the entire plan for liberty loan work throughout the country. He was made a partner in Blodget & Company in 1919. In addition to being president of the new company, Mr.

Digitized by Google

Pope is also a director in a number of other corporations, including Engineers Public Service Company, General Public Service Corporation, Virginia Electric & Power Company and New England Power Association.

Illinois Power & Light Purchasing Department Changes

Changes have been announced in the organization of the purchasing department of the Illinois Power & Light Corporation, Chicago, Ill.

Frank H. Hughes is appointed supervisor of purchases with headquarters at Chicago.

H. J. Vance is appointed purchasing agent for the Illinois properties of Illinois Power & Light Corporation, acting in that capacity both for the various Illinois divisions and for the Illinois Traction System. Mr. Vance also will have direct charge of the Decatur storehouse, and his offices will be located at Decatur.

J. A. Jefferis is appointed fuel purchasing agent with headquarters at St. Louis, having responsibility for the purchase of coal and other fuels for all the various state groups of the company.

G. M. Eaton with Molybdenum Corporation

G. M. Eaton, chief mechanical engineer of the Westinghouse Electric & Manufacturing Company, has identified himself in a sales engineering capacity with the Molybdenum Corporation of America.

With Westinghouse he soon associated himself prominently with railroad electrification problems and his success in that field is attested by his prominence in work associated with the mechanical features of electric locomotives for the Pennsylvania, the New York, New Haven & Hartford, the Norfolk & Western and the Chicago, Milwaukee & St. Paul Railroads.

In 1910 Mr. Eaton was appointed division engineer of the railway department, where the scope of his activities was widened. In 1919 he was made chief mechanical engineer of the Westinghouse company. Many inventions are accredited to him. They include developments in the field of complete locomotive design, motor mounting, motor details and overhead line construction. He will continue a curtailed association with the Westinghouse company in the capacity of consultant on mechanical engineering problems.

Changes in Kewanee

In line with the new plans for supplying current to the Kewanee Public Service Company, Kewanee, Ill., a change will be effected in the personnel. Jean DeCamp, superintendent of the railway system for the last two years, and Max Bertch, master mechanic, will leave soon for Texarkana, Tex., where they will join the Southwestern Gas & Electric Company, occupying positions there similar to the ones they held in Kewanee. E. T. Crocker, Quincy, has been transferred to have charge of the railway at Kewanee.

A. T. Spencer at Montreal

Former Toronto Official Becomes General Superintendent of Construction and Maintenance of Quebec Property

A. T. Spencer has joined the staff of the Montreal Tramways, Montreal, Que., with the title of general superintendent of construction and maintenance. Since May, 1924, he has been assistant to the general manager of the Toronto Transportation Commission, Toronto, Ont., operating the municipal electric railway there. Before that he was engineer of way of the Toronto Commission. As assistant general manager at Toronto he continued to supervise the operation of the way department.

HELPED TO REHABILITATE TORONTO PROPERTY

Mr. Spencer was appointed to the important position of engineer of way of Toronto Transportation Commission in May, 1921, in anticipation of the extensive rehabilitation program which began when the commission took over the local lines the following September. This work might have been accomplished in a leisurely manner, but the idea of leisure in rehabilitating the property of the Toronto Railway did not enter into the thought of the Transportation Commission, appointed by the city to take over and operate the Toronto Railway and consolidate it with the lines then owned by the city. The city had suffered too long from bad tracks and poor cars and been inconvenienced in too many other ways to be at all tolerant of any program which countenanced dallying with the work in hand.

A. T. Spencer

200 MILES OF TRACK REBUILT

As explained in the ELECTRIC RAILWAY JOURNAL for May 10, 1924, in the personal about Mr. Spencer at the time he was made assistant to the general manager at Toronto, quantity production methods were worked out for the reconstruction of nearly 200 miles of track, and the matter was handled so well under his direction and supervision that all of the work was done during two seasons. In order to carry out this work successfully in the very short space of time in which Mr. Spencer accomplished it, he had to resort to many novel methods and to exercise a great deal of ingenuity.

Mr. Spencer brought to the work which he did at Toronto a fund of information gained while serving with other railways and while engaged in other similar lines of work. For a few months prior to his appointment under the Toronto Transportation Commission in May, 1921, he acted as assistant engineer in the railway department of the Hydro-Electric Power Commission of Ontario. Before that he had been connected with the Montreal Tramways, first as assistant engineer in charge of maintenance of way and later as chief engineer of this department. Previous to that he was employed by the Canadian Pacific Railway on grade revision in New Brunswick, Quebec and Ontario. In 1907 he was appointed assistant engineer of the Montreal Park & Island Electric Railway, and it was from this company that he went to the Montreal Tramways.

Mr. Spencer entered upon his engineering career in 1901 with the Dominion Coal Company and the Sydney & Louisberg Railway. He was born in Nova Scotia and there received his general and technical education. In all the work that he has done Mr. Spencer has shown a remarkable capacity for carrying out the job efficiently.

ACTIVE IN ASSOCIATION WORK

He is a member of the standing committee on way and structures of the American Electric Railway Engineering Association and is chairman of the special committee of that association appointed to study the use of alloy steels, other than manganese, in special trackwork. He is an associate member of the Engineering Institute of Canada, a member of the Association of Professional Engineers of Quebec, a member of the Association of Professional Engineers of Ontario and a member of the American Society of Municipal Improvements.

A. P. Way, formerly assistant electrical engineer of the American Electric Power Company, successor to the American Railways, Philadelphia, is now assistant engineer in the electrical division of the Department of City Transit at Philadelphia. He was connected with the Wilmington & Philadelphia Traction Company, a subsidiary of the American Electric Power Company, immediately before taking his present position.

Roy L. Zinstine has been appointed supervisor of safety and first aid of the electrical department of the Pennsylvania-Ohio Electric Company, Youngstown, Ohio. This is a newly created position. In 1921 Mr. Zinstine went to the Pennsylvania-Ohio system as a truck driver in Youngstown. He was one of the 26 employees who elected to take the Red Cross first aid training in the institute organized by Dr. Redden.

R. G. Soper has been elected treasurer of the Southwestern Public Service Association, Dallas, Tex. For many years Mr. Soper was active in the manufactured and later the natural gas industry. He was also secretary of the Dallas Gas Company.

Digitized by Google

W. G. Holmes has been appointed industrial agent for the Interstate Public Service Company, Indianapolis, Ind. Mr. Holmes was connected with the Indianapolis Chamber of Commerce at the time of his appointment. He is a graduate of Colgate University, where he specialized in mathematics, engineering and economics and where he served as assistant instructor in engineering two years prior to his graduation. From September, 1925, to March, 1926, he was with the Bureau of Business Research at Indiana University. As industrial agent of the Interstate he succeeds the late Anderson G. Moore.

R. M. Vaughan, who has been in charge of valuation work in the engineering department of the California Railroad Commission for a number of years, has resigned to engage in private practice.

B. M. Lathrop recently retired as general superintendent of the Colorado Springs & Interurban Railway, Colorado Springs, Col. He had been associated with the company for the past 25 years.

A. E. Haak has succeeded B. M. Lathrop as general superintendent of the Colorado Springs & Interurban Railway, Colorado Springs, Col. For some time he has been purchasing agent of this company. He will continue in that capacity.

J. J. Flynn has been appointed general storekeeper for the Chicago Rapid Transit Company, Chicago, Ill., succeeding R. R. House, who was recently promoted to general superintendent of stores for the four electrically operated railroads under the management of the Insull interests. Mr. Flynn has been an employee of the Chicago Rapid Transit Company for fourteen years.

Francis J. Gannon has resigned as assistant treasurer of the Northern Texas Traction Company, Fort Worth, Tex., to take over the duties of assistant treasurer and secretary of Davis Islands, Inc., a development at Tampa, Fla., under Stone & Webster management. He had been assistant treasurer of the Northern Texas Traction for the past ten years. More recently he had also been handling the advertising for the company. A. A. Chamberlain has succeeded Mr. Gannon as assistant treasurer.

Dr. W. B. Coffey, chief surgeon of the Market Street Railway, San Francisco, Cal., for almost 25 years, resigned as head of the medical department to become chief surgeon and general manager of the Southern Pacific Hospital System.

Charles H. McEachron has recently been appointed superintendent of the Tacoma Municipal Belt Line, Tacoma, Wash. He succeeds in this capacity A. Gunderson. Reconditioning of the rolling stock of the belt line will be undertaken at once by the newly appointed superintendent, it was stated by Mayor M. G. Tennent. The appointment is temporary, it is said. Mr. McEachron has been foreman of the machine shop of the Tennent Steel Casting Company, of which Mayor Tennent is the head, for the last three years.

James Dalrymple Retires

Glasgow Manager with World-Wide Reputation Will Relinquish Post After 46 Years of Service

James Dalrymple, general manager Glasgow Corporation Tramways, Glasgow, Scotland, recently intimated to the tramway committee of the corporation that he is prepared to retire from his position. The information was conveyed to the committee in the course of a discussion on a proposal that a considerable number of tramway employees who were dismissed by the manager because of their action during the general strike in May last should be reinstated. This proposal had come before the committee on previous occasions, and Mr. Dalrymple was firm in his attitude that as regards the particular men he would not take them back. In this he was supported by the majority of the committee and the Council. Despite this indorsement of him, Mr. Dalrymple decided that, taking all the circumstances into consideration, it would be inexpedient for him to carry on. He therefore intimated that he now proposed to exercise, as he was entitled to do under the corporation's scheme of superannuation, the option he had of retiring. He added that he wished to be relieved of his duties Dec. 31.

In all this politics has played its part. At a recent municipal election the socialist party gained a number of seats, and though the socialists are still in a minority, their number is now nearly as great as that of the moderate party. It is said that some of the latter were absent from the meeting of the committee on Nov. 18 so that the socialists had a small majority and carried their motion for reinstatement. Meanwhile Mr. Dalrymple had sent in his notice of willingness to retire. A small committee was appointed to consider the terms on which the resignation would be accepted.

Mr. Dalrymple has been in the service of Glasgow Corporation for 46 years. He was originally in the accounting department. When the tramways were municipalized in 1894 he became tramway accountant, and in 1902 he was appointed deputy general manager. Some two years later when the late John Young, then general manager, resigned in order to take a similar position with the Metropolitan District Railway, London, Mr. Dalrymple was appointed general manager. That post he has held since with conspicuous ability and success, both as regards the operating and financial sides of the undertaking. Under him the Glasgow Tramway has not only maintained its position as one of the successful undertakings of its kind in Great Britain, but has enhanced its position.

Mr. Dalrymple has visited the United States from time to time to study traffic conditions. On one memorable occasion when he was called in to advise, he strongly opposed the municipalization of railways in Chicago. By means of personal inspection he has also mastered street transport conditions on the Continent of Europe. Two years ago he went on invitation to Bombay, India, to advise as to the tramway development in the city. During the war he raised a battalion from among the Glasgow tramway employees in one day, and others followed. For these and other services during the war he received the C.B.E. decoration.

It was through Mr. Dalrymple's successful efforts during the general strike in May last to maintain tramway service in Glasgow by the engagement of volunteers that he incurred the enmity of socialists in the Town Council. The hostility thus aroused against him has been intensified by his subsequent refusal to reinstate certain strikers. It appears that he was willing to consider applications from some of them in the event that vacancies arose but he would not agree to reinstatement of the men en masse at present.

P. E. Dufour has been appointed valuation engineer of the California Railroad Commission, effective Jan. 1, 1927, to succeed R. M. Vaughan, who recently resigned from the service of the commission. Mr. Dufour has been with the transportation division of the commission's engineering department since March, 1921, at which time he was employed to make an extensive check of the federal valuation of the steam railroads in California. He has handled the valuation work on several of the large investigations made by the commission. Previous to his employment by the state Mr. Dufour was associated for six years with the bureau of valuation of the Interstate Commerce Commission. In addition to this work he has had considerable railroad experience, having been employed a number of years with the Southern Pacific Company, six years of which time he was assistant engineer in charge of railroad construction in California and Oregon. He was graduated in 1904 from the Van der Naillon School of Engineering.

B. P. Shearon has been elected secretary of the Northern Indiana Public Service Company, Hammond, Ind. He succeeds W. D. Boone, who has resigned because of illness. Mr. Shearon has been connected with the company for nineteen years. He formerly was comptroller of the company and for the last two years has been assistant secretary and assistant treasurer.

Obituary

Joseph Alvin Reckard, for 26 years cashier of the Los Angeles Railway, Los Angeles, Cal., died recently. Mr. Reckard was 66 years old. Prior to his going to the Los Angeles Railway in 1900 he was agent for the Toledo, Peoria & Western Railway at Fairbury, Ill.

Frederick G. Orcutt, assistant paymaster of the Connecticut Company at Hartford, Conn., died on Dec. 2 at his home in that city. Before going to the Connecticut Company he had been employed in similar capacities by the Boston & Maine and the New York, New Haven & Hartford Railroads. Mr. Orcutt was born in 1862.

for Discussion of Manufacturing and Sales Matters

Big Car and Bus Purchase Program at Atlanta

Ten new single-deck coaches have been placed in service by the Georgia Railway & Power Company, Atlanta, Ga. Purchase of the new coaches raises still higher the record of new transportation equipment purchased during the year, a mark which already had eclipsed any previous year in Atlanta's history. In addition to the ten coaches, the company has purchased and placed in service during 1926 60 new street cars for city lines and ten new de luxe interurbans for the Atlanta Northern and Stone Mountain lines.

Westinghouse Gets Big Order in Brazil

Award of a contract from the Paulista Railway in Brazil for the extension of that road from Rio Clare to San Carlos, a distance of 42 miles, has been made to the Westinghouse Electric International Company. This contract includes complete transmission line equipment, catenary contact system, together with necessary substation equipment and locomotives. The locomotives to be furnished will be duplicates of several built by the Westinghouse company and shipped to Paulista a few months ago. They represent the fourth order for that company to be placed with the Westinghouse company. The contract price for this present order is in the neighborhood of $1,500,000, it is reported.

M. J. A. Bertin Heads Galena Signal Oil

M. J. A. Bertin, who for several years has been in charge of the European business of the Galena Signal Oil Company, has been elected president and a director, succeeding L. J. Drake, who resigned to become president of the Union Tank Car Company.

Twin Cities Improvements Intimated

Improvements for 1927 to be made by the St. Paul City Railway, St. Paul, Minn., will cost about $350,000, with no definite outline yet made. A proposed new interurban line connecting the Franklin Avenue line in Minneapolis with the Rondo-Maria line would cost the St. Paul company $1,500,000, according to T. Julian McGill, vice-president of the Twin City Rapid Transit Company, and would require a larger fare. Otherwise construction of the line would not be possible for some years.

In Minneapolis the requests for railway extensions and improvements would, if carried out, cost the Minneapolis property $600,000 more than the fund available. In 1926 the outlay was $650,000, but for 1927 it will be less than this sum.

Oil-Electric Locomotive in Lumber Service

A new use for oil-electric locomotives has been found with the placing of a 100-ton unit of this type in service at Westwood, Cal., hauling logs from the woods to the mill of the Red River Lumber Company. The locomotive was built jointly by the American Locomotive Company, Ingersoll-Rand Company and the General Electric Company, and is similar in its general characteristics to other oil-electric units of the same tonnage which have been built for use by various railroads in the past years. The unit, which is operated by the Red River Lumber Company, is kept in daily operation over a 20-mile section of track.

Cold Facts at Disposal of Manufacturers

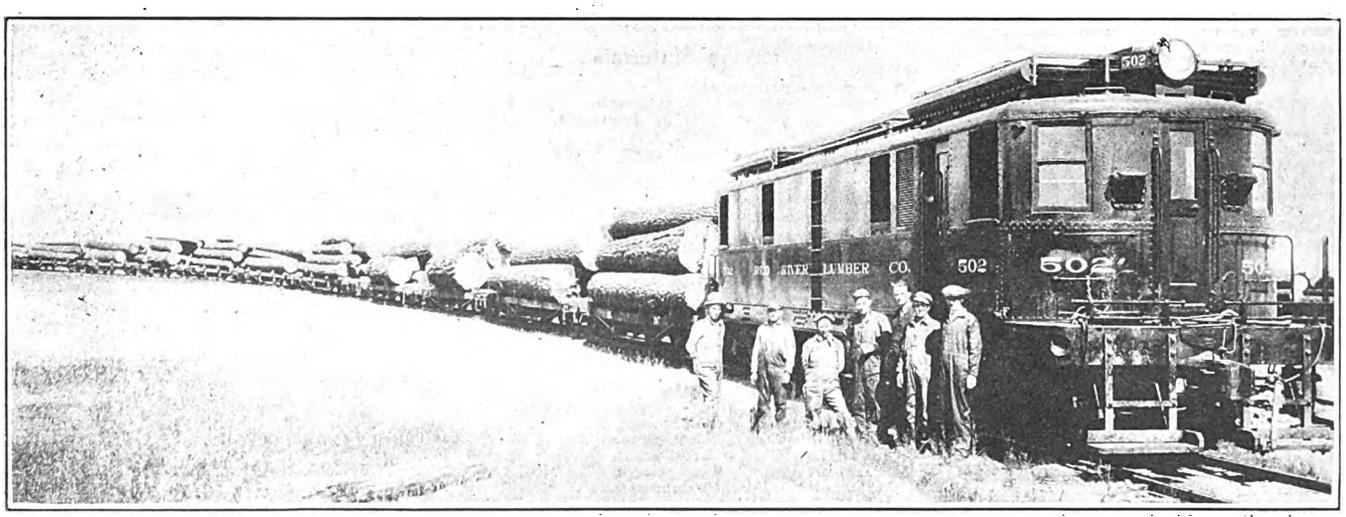
Discussion of Results Obtained with New Equipment Given by Charles Gordon at Cleveland Convention Ready in Booklet Form

Early in the week of the American Electric Railway Association convention in Cleveland last October a group of important electric railway manufacturers and their representatives gathered together at the invitation of James H. McGraw, president of the McGraw-Hill Publishing Company, Inc., to discuss various conditions affecting the purchase of new equipment in the industry. At this meeting Charles Gordon, editor of ELECTRIC RAILWAY JOURNAL, analyzed carefully the results which are actually being obtained by various properties which have shown a willingness to modernize their rolling stock. The questions of whether it costs less to buy new cars than to maintain old ones and whether the industry is actually paying for new equipment and then not getting it were answered in no uncertain terms.

So many requests were received by the JOURNAL for copies of Mr. Gordon's remarks that it was decided to publish them in booklet form for general distribution. Copies are being sent to manufacturers throughout the industry and an adequate supply of additional copies has been prepared for distribution to those who may request them. The booklet is illustrated with a number of charts which graphically portray the anomalous condition which is in existence at the present time and the common sense answer to the whole puzzling situation. It is hoped that this compilation of specific facts will prove of material assistance in the campaign to infuse new blood into the veins of the industry through the guise of modern rolling stock.

New Testing Laboratory for Delta-Star Electric

The Delta-Star Electric Company, manufacturer of unit type high-tension equipment, has constructed a new large testing laboratory in its plant at Chicago, Ill., for the use of its designing



Type of Load Hauled by This Oil-Electric Locomotive

Digitized by Google

engineers. The company feels that this will afford the means of securing the data necessary so that the equipment offered for sale will meet the severe conditions imposed by modern interconnection of the transmission system.

Included in the equipment of the laboratory are transformers, each of 250 kva. capacity and weighing approximately 18 tons each. They have primaries of 2,000 volts, secondaries of 250,000 volts and are arranged for the cascade or chain connection.

Excitation and control of the transformers is secured by a synchronous motor-generator set, the 2,000-volt winding of the first transformer being connected directly to the alternator. With three transformers in series there are 750,000 volts between the high-tension terminal of the third transformer and ground.

Another Instance of Manufacturer Co-operation

In mailing its recent dividend checks to stockholders, the Westinghouse Electric & Manufacturing Company expressed the hope that they would endeavor to ascertain the facts regarding local electric railway service and lend a helping hand toward establishing a favorable attitude of mind toward the electric railway. It said that this would result not only in better service for the people, and aid the prosperity of the stockholder's neighborhood, but would also benefit him as a part of the great Westinghouse organization.

The company said that the electric railway system of any city is a true mirror of the progressiveness of that community, for upon these transportation facilities, as a keystone, depend social and industrial progress. It then set forth these facts:

Since the establishment, 40 years ago, of the first transportation systems operated by electricity, this industry has made steady and healthy progress until today it represents an investment of $6,000,000,000 with securities held by 1,300,000 people; operates 105,000 cars and 50,000 miles of track; and carries more than 16,000,000,000 passengers annually.

Your company has been privileged to be identified with this basic public utility for the past 40 years and is in a particularly favorable position to appreciate the full value of its service and the importance of public understanding and co-operation.

For the past decade your company has endeavored to tell the public the facts and thereby to secure a better public understanding of the economic service rendered by the electric railways. This has been accomplished by a consistent program of co-operative advertising in the leading national popular media such as *Forbes*, the *Literary Digest*, *Scientific American*, *Collier's*, the *Nation's Business* and *Saturday Evening Post*, and in many financial papers.

In Special Publication 1751, "Electric Railways—The Keystone of Progress," are reproduced some of the most important of these advertisements. The 24 illustrated represent a combined circulation of 26,324,000, or in reality that number of individual messages delivered in behalf of the electric railway industry.

Large Equipment Order Placed by Long Island

Electrical equipment valued at approximately $700,000 is to be added by the Long Island Railroad. This expenditure will be made on equipment for 60 motor and 30 trail cars. The order calls for a duplicate of equipment previously purchased from Westinghouse by the railroad. Delivery is to be made in the spring to meet the requirements of heavy traffic. When the added cars go into operation the Long Island Railroad will have in service approximately 700 Westinghouse equipped motor cars.

Rolling Stock

Chicago, Aurora & Elgin Railroad, Aurora, Ill., is reported to be inquiring for fifteen additional interurban cars at the present time.

Utah Light & Traction Company, Salt Lake City, Utah, has purchased two 230-in. wheelbase Mack bus chassis, on which will be mounted Duralyte street car type bodies. The buses will be put in trolley feeder service between Bountiful and Centersville, an 8-mile route at a 20-cent fare. The schedule calls for eighteen trips daily.

Chicago, South Shore & South Bend Railroad, Michigan City, Ind., is making inquiries for ten motor cars and ten trailers.

Brooklyn City Railroad, Brooklyn, N. Y., expects to issue specifications about Feb. 1, 1927, for from 175 to 190 new cars. Since this matter was referred to originally in the ELECTRIC RAILWAY JOURNAL, issue of Nov. 20, page 952, it has been decided that the new rolling stock will be similar to the cars now on the property, known as type 8,000. After these cars are delivered and older cars have been retired the company will have no cars in operation built earlier than 1920.

New Advertising Literature

General Electric Company, Schenectady, N. Y., has issued a leaflet describing its new automatic welding head which provides automatic electrode feeding of the magnetic clutch type. The welding head and control are available either separately or as a part of a complete automatic welding equipment.

Ohmer Fare Register Company, Dayton, Ohio, describes its Odometer in a publication issued recently. This device is intended for application to electric and steam railway cars, trucks, buses and Drivurself cars. The company says that the Ohmer Odometer for railway service accumulates total mileage whether the car is going forward or backward. It requires no attention after once applied, and continuous, accurate and uninterrupted mileage reading are assured. When applied to railway service there is no change in the head or principles of its operation.

Pennsylvania Railroad, Philadelphia, Pa., has placed orders for 60 all-steel electric cars for suburban service in the Philadelphia district. The orders were distributed as follows: Standard Steel Car Company, 30; Pressed Steel Car Company, fifteen, and American Car & Foundry Company, fifteen. Electrical equipments for these units were ordered some time ago, as reported in the issue of the JOURNAL for Nov. 13, page 912. The cars will be placed in service early in 1928 upon completion of electrification between Philadelphia and Wilmington, Del., and Philadelphia and West Chester, Pa.

ELECTRIC RAILWAY MATERIAL PRICES—DEC. 14, 1926

Metals—New York

Copper, electrolytic, cents per lb.	13.375
Lead, cents per lb.	7.887
Nickel, cents per lb.	35.00
Zinc, cents per lb.	7.41
Tin, Straits, cents per lb.	68.625
Aluminum, 98 to 99 per cent, cents per lb.	27.00
Babbitt metal, warehouse, cents per lb.:	
Commercial grade	63.00
General service	32.50

Bituminous Coal

Smokeless mine run, f.o.b. vessel, Hampton Roads	$9.00
Somerset mine run, Boston	3.25
Pittsburgh mine run, Pittsburgh	2.75
Franklin, Ill., screenings, Chicago	1.875
Central, Ill., screenings, Chicago	1.725
Kansas screenings, Kansas City	2.35

Track Materials—Pittsburgh

Standard steel rails, gross ton	$43.00
Railroad spikes, drive, Pittsburgh base, cents per lb.	2.90
Tie plates (flat type), cents per lb.	2.35
Angle bars, cents per lb.	2.75
Rail bolts and nuts, Pittsburgh base, cents, lb.	4.20
Steel bars, cents per lb.	2.00
Ties, white oak, Chicago, 6 in.x8 in.x8 ft.	$1.45

Hardware—Pittsburgh

Wire nails, base per keg	2.65
Sheet iron (24 gage), cents per lb.	3.00
Sheet iron, galvanized (24 gage), cents per lb.	3.85
Galvanized barbed wire, cents per lb.	3.35
Galvanized wire, ordinary, cents per lb.	2.50

Waste—New York

Waste, wool, cents per lb.	12-18
Waste, cotton (100 lb. bale), cents per lb.:	
White	13-17.50
Colored	10-14

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), cents per lb.	11.40
White lead in oil (100 lb. keg), cents per lb.	14.00
Turpentine (bbl. lots), per gal.	$0.91
Car window glass, (single strength), first three brackets, A quality, discount*	84.0%
Car window glass, (single strength), first three brackets, B quality, discount*	86.0%
Car window glass, (double strength) all sizes, A quality, discount*	85.0%
Putty, 100 lb. tins, cents per lb.	5.25-5.50

* Prices f.o.b. works, boxing charges extra.

Wire—New York

Copper wire, cents per lb.	15.75
Rubber-covered wire, No. 14, per 1,000 ft.	$6.00
Weatherproof wire base, cents per lb.	17.50

Paving Materials

Paving stone, granite, 5 in. New York—Grade 1, per thousand	$142.40
Wood block paving 3½, 16 lb. treatment, N. Y., per sq.yd.	$2.70
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots	51.00
Paving brick 3x8½x4 N.Y., per 1,000 in carload lots	45.00
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd.	1.94
Cement, Chicago consumers' net prices, without bags	2.10
Gravel, ¾-in., cu.yd., f.o.b. N. Y.	1.75
Sand, cu.yd., f.o.b. N. Y.	1.00

Old Metals—New York and Chicago

Heavy copper, cents per lb.	10.85
Light copper, cents per lb.	9.25
Heavy brass, cents per lb.	6.50
Zinc, old scrap, cents per lb.	4.25
Lead, cents per lb. (heavy)	5.75
Steel car axles, Chicago, net ton	$17.25
Cast iron car wheels, Chicago, gross ton	14.75
Rails (short), Chicago, gross ton	16.50
Rails, (relaying), Chicago, gross ton	28.50
Machine turnings, Chicago, gross ton	6.75

Another Shift in the New York Commissions

CHANGES in the public service commission law of New York enacted by the last Legislature will go into effect on Jan. 1. They are part of the so-called reform and economy program of Governor Smith. Among other things a new public service department is created to be headed by the chairman of the present Public Service Commission. This body will take over the Public Service Commission, which has jurisdiction elsewhere than in New York City, and the Transit Commission, which is local to the greater city. That is only part of the story. Under the provisions of the state department law, passed by the 1926 Legislature, the Governor will have control over sixteen out of the eighteen groups of governmental machinery with czar-like power of appointment and removal.

The changes about to be put into effect are just another instance of the tinkering in recent years with the administration of the public service law. For some time after the passage of the original legislation back in 1907, under Governor Hughes, there was no tendency on the part of legislators to toy with the law. Since then, however, there has been hardly a legislative session at which some changes have not been advocated. This is cited as a fact, not as a justification or a condemnation.

The excuse for the present consolidation of activities of the regulatory commissions is that they are both quasi-judicial bodies doing the same kind of work. At the time of the approval of this latest change, considerable doubt was expressed as to the advisability of the move Next in importance, perhaps, to the consolidation is the restoration to the Governor of the right of removal of commissioners on charges. The original law, enacted under Governor Hughes, provided this feature. Under the administration of Governor Miller, the law was amended so that a member of the commission could be removed only on a two-thirds vote of the Legislature.

During the 1926 session of the New York Legislature nothing more was attempted than to arrange the structural framework necessary to group the activities of the more than 150 departments and bureaus of the state into eighteen departments. Since the adjournment of the Legislature, however, a reorganization commission has been at work preparing amendments to the law to make the transfers of legal authority such as are necessary to insure the functioning of various activities of government. Already Governor Smith is suggesting still further modification of the public service commission law, as referred to elsewhere in this issue. Legislation to this end will undoubtedly be introduced early in the coming session. Still further changes would appear to be necessary to the public service commission law and the state department law defining the general structure of the new department of public service. As indicated before, the practicability of the present arrangement has been seriously questioned. That is a point which can be settled only by the actual results recorded under the new arrangement.

Retail Merchants Have a Direct Interest in Transportation

THE record of the attitude taken by retail merchants on the transportation question is not a particularly enviable one. It has been narrow rather than broad, nearsighted and expedient rather than constructive. Although transportation is primarily a community problem, the merchants' attitude has consistently worked against sound progress.

Opposition of retail merchants was largely responsible for the abandonment of skip-stop operation in many cities despite the obvious advantages which this plan offered in expediting the movement of people between their homes and central business districts. The merchants were more interested in forcing every car to stop at their particular corner than in expediting the movement of the entire mass of riders.

Much the same attitude has been taken on the parking question. Each merchant in the congested business districts would be perfectly content to advocate parking restrictions, provided that these did not apply in front of his own establishment. When a rerouting plan is proposed to reduce congestion through the elimination of overlapping or interference between various car routes, downtown merchants are usually in favor of the plan provided the routing is laid out so that every car in the city passes their front door. Even the construction of by-pass highways to route through automobile traffic around business district congestion is frequently opposed by downtown merchants on the ground that prospective customers will be deflected from their establishments.

Business growth in the central areas of American cities lags far behind the rapid increase in outlying community centers. This condition is unquestionably attributable to the attitude of central district merchants. Unless they awaken to the situation this trend will ultimately destroy the value of a central location. People will not and should not tolerate existing conditions. The growth of outlying business centers offers a solution—and spells the ruin of downtown merchants and property owners.

The action of Chicago merchants in advocating the development of transit facilities in the central district at their own expense is particularly significant. In most cities opportunities exist for improving surface travel facilities so as to avoid a large part of the heavy cost of rapid transit construction. Establishment of express streets, skip-stops and the elimination of park-

Digitized by Google

ing would bring immediate improvement at negligible expense.

Merchants who are beginning to understand the relation between their own welfare and that of their community are taking a more constructive view of current local transportation problems.

It is high time that other merchants awakened to the situation. They are definitely faced with the reluctance of shoppers to submit to the inconvenience and danger of the intolerable congestion which exists in most central business districts. The day has passed when downtown merchants can afford to consider only their own business to the exclusion of the community's convenience and welfare.

Foremen's Conferences Help to Improve the Shop Service

AT A MEETING of the New York Railroad Club on Oct. 15, helpful information was given on methods being followed by a number of the steam railroads in and about New York to better the working conditions of shop and other equipment employees. Thus this meeting assists, at least in part, to answer the question raised last week, i.e., how to recruit the right kind of men in the equipment department, how to keep them there in a contented state of mind, and how to train them for more responsible, and consequently more lucrative, positions in the future. All of these answers are based on the establishment of educational courses for both foremen and those in less responsible positions in railway mechanical departments.

Some of the steam roads have developed the apprentice system extensively and these courses appeal with especial force to the average railway apprentice because they mean he will have special instruction fitted to his needs, whether he has had merely a high school education or is a college graduate. The large number of young men annually enrolled in correspondence schools shows the desire that most of them have, especially when their opportunities for school attendance have been limited, to supplement their education, usually along the lines of the industry in which they are engaged at work. Railway educational courses allow them to do this while receiving pay and working in surroundings conducive to study, i.e., in association with other minds keen on acquiring the same knowledge, under personal instruction, and with large "laboratory" facilities.

The foremen's training courses, described in the New York Railroad Club papers, are of a different nature, but their popularity has been such that their number among large railroad and industrial corporations has increased very rapidly during the last few years. The purpose of such conferences is partly to broaden the background of foremen by exchanges of experience among themselves, partly to bring to their attention desirable methods applicable to their work which have been developed elsewhere, perhaps outside of the industry, and partly to allow them to pursue studies along collateral lines, such as legal, financial and accounting matters related particularly to their industry.

Testimony of the popularity of both the apprentice courses and foremen's conferences among the railroads entering New York was given in much detail in the series of papers before the New York Railroad Club, already mentioned. In this case, age seems to have made no difference. Thus, one group of foremen's conferences was mentioned in which the work scheduled was to have finished in April, but the class was so enthusiastic that the meetings were carried on until the latter part of June, when the summer weather made further continuation impracticable, yet three or four men in the class were upward of 70 years of age, and at least seven were over 60.

Possibilities for Foremen Conferences on Electric Railways

IN PERHAPS no industry are the reasons for both apprentice schools and foremen conferences so outstanding as in the electric railway industry. In manufacturing, mechanical methods necessarily have to be more or less standardized according to the article being produced. But a railway shop is devoted primarily to repairs. In other words it is designed not to turn out one finished article only, but to undertake a thousand pieces of work, each differing from the other in considerable detail, because of the nature of the repair and the type of equipment repaired.

In a sense also an electric railway company is better able to carry on such a series of conferences than a steam railroad because its shops usually are in one city so that all of the foremen can easily be gathered together for conferences and discussions. Nevertheless, as shown by the report of the committee on education at the Cleveland convention, not very much is being done along these lines by electric railway companies. A conspicuous exception is the notable work being done on the Boston Elevated Railway, under the direction of Prof. H. H. Norris, whose illuminating representations of foremen's conferences, given at the Cleveland convention as well as previously at Indianapolis and Boston, have done much to awaken interest in this subject on the part of the industry at large.

Some electric railway companies may be deterred from engaging in foremen's conferences because they consider that they are not large enough, having perhaps only three or four foremen. In this case, the wisest plan is undoubtedly to join with some industry in the town in which they are situated. It will be found that many of the problems of the railway and industrial foremen are alike. This applies very largely, of course, to labor matters and to accounting, and probably to some extent to mechanical processes, such as the use of tools, methods of electric welding, etc.

If the testimony given by other industries as to the benefits derived from courses of this kind is true, and there is no reason to doubt it, a long step forward can be taken in the improvement of equipment methods.

Milwaukee's Open House Week a Remarkable Expression of Public Service

SELDOM has the family spirit of a utility been more strongly developed than in Milwaukee. This spirit permeates beyond the officials of the company, beyond even the employees, and out into the community the company serves. The recent "at home" the company held was equally a success among employees, stockholders and the consuming public. On stockholders' day,

Digitized by Google

out of 16,000 tickets requested, almost 12,000 were used. These owners of the property were glad of the opportunity to see the different units that earned the dividends on their invested savings. Many of the men and women, old in years, marveled at the wonders they saw. Many expressed themselves as well pleased at the splendid exhibits, and several comments were made, such as "I guess my money is safe here and I have some more next time some stock is offered."

It is difficult to estimate the value of such an affair. Even the company officials hesitated to hazard a guess. It is not measurable on any known basis, but certainly the company that has gained from its customers the kindly feeling of pride exhibited has an asset of great grip, the crisp greenback.

Not alone is this an asset to the company. It is likewise a means of instilling that pride of good service in officers and employees alike that should be an inspiration toward still greater efforts. There should be in every one's life something more than merely making a living—that much is only instinctive. Public service through any of our utilities offers that other element of value to employees of such companies, and the promotion of the service spirit by such public exhibits as Milwaukee's "Open House" week would be of value if it did nothing more than this.

Whose Stocking Is Filled— The Policeman's or the Conductor's?

A CONDUCTOR is only a conductor, but a policeman swings a big stick. Hence the abrupt and often distinctly rude manner adopted toward railway employees by the general public—hence also the honeyed demeanor and almost sycophantic regard frequently expressed by rich and poor alike for the minions of the law. It is not the car operator whose feet are submerged in piles of big and little gifts at Christmas time. He is fortunate to receive a scant "Merry Christmas" from his impatient passengers. It is the hand that writes the traffic "ticket" which receives the warm caress, the crisp greenback.

Yet the policeman is no whit above the average railway employee in his social stratum. A conductor or a motorman occupies a position of responsibility and trust fully as great as the guardian of the city's peace. It is true that there is nothing about him to inspire fear—which, after all, probably motivates the average man in his attempt to cultivate the members of the "Force"—fear, and a desire to obtain special privilege.

But the platform man has certain perquisites which are denied even to the members of the constabulary. He comes daily into close personal contact with his patrons—he is vouchsafed countless opportunities to render little acts of thoughtfulness to those whom he serves—in short, he may, if he wishes, become even more a living, breathing personality in the eyes of the car riders than the blue-coated man of the street intersection. If he is but a numbered automaton with a gruff attitude and a strident voice, he can blame only himself.

Several companies have adopted the scheme of providing their platform men with name badges. Where this has been done, it is worthy of note that patrons have soon fallen into the habit of addressing the railway representatives by name. From the standpoint of the operators and conductors, it would be well if a similar procedure could be adopted for the patrons.

An individual's personality is practically the only thing which cannot be taken from him—it is his to do with as he will. The policeman has behind him the majesty of the law. The conductor has the greater majesty of his own individuality and, in an ever-increasing number of cases, the knowledge that his company stands ready to reward him with greater responsibility as he distinguishes himself in the outpost line of company representatives.

Modern Industry Recognizes Its Responsibilities

CONVINCING evidence is furnished on all sides of the growing appreciation of its responsibilities by modern industry. It is a theme that is constantly recurring as a topic of discussion where business men assemble. Here and there the scoffer may appear, but he is crushed by the weight of the record of accomplishments. In this work of trying to humanize industry, few companies have done more than has the General Electric Company, and few men who have discussed the matter have reduced the subject as a science to simpler terms than did Gerard Swope, president of the General Electric Company, in an address made recently at the annual dinner of the Associated Business Papers. He said modern business was responsible to society in this order: the public, the employee, the shareholder and the industry itself. His conception of industry was that it is not primarily for profit, but for service.

Mr. Swope was very outspoken. He did not seek to make a virtue out of the work of his own company. He said that we know of no better system today than the capitalistic system for rewarding individual effort or corporate effort. In this he is right. The iniquities of the large corporation are as nothing compared with the iniquities of the small proprietor, where the latter still persists in modern society. If industry wants the workers to give to their work the best that is in them, it should remove fear for the future, as the element that has in the past disturbed the worker most. Mr. Swope's plan of approach to the removal of these fears contemplates full recognition by industry of its responsibility to insure employees, see that they are properly housed, urge the value of thrift upon them and deal more forcefully with the problem of unemployment. This is, of course, merely the outline. It certainly is the duty of industry fully to assume these obligations. Mr. Swope made that plain.

So far as the public utilities are concerned, they have long since been in the vanguard of the movement. Instance upon instance could be cited of companies in which each of these things has been carried to a high state of development and it does not seem unreasonable to say that nearly every company of any size has a program that contemplates one or all of these activities. A recent exhibit of the Employees' Mutual Benefit Association of Milwaukee illustrates the wide range of benefits promoted and made possible through co-operation and recognition of public service duty in this modern business organization. Then there are the many other instances of similar activities in the railway field, notably in Philadelphia, Kansas City, St. Louis and other places. They are cited merely to show that industry is recognizing its obligations and to give an idea of the extent to which the program suggested by Mr. Swope has been anticipated in some instances.

Chicago's Dilemma Illustrates the Evils of the Fixed Term Franchise

In the Year of the Chicago Surface Lines' Highest Revenues and Most Efficient Performance the City Is Far from a Solution of Its Difficulties—One of the Underlying Companies Thrown Into Receivership on Account of the Fictitious Crisis Created by Expiration of Surface Lines' Franchises on Jan. 31, 1927

WITH the approach of Jan. 31, 1927, comes the fateful day which will mark the political crisis that confronts the Chicago Surface Lines and the millions of car riders who daily depend on the service of this largest of street railway systems. Though this group of properties is a financial success, and is providing more service and carrying more passengers than ever before, the Chicago Railways Company, comprising the North and West Side lines, has already been thrown into receivership to protect the interests of the investors. The other underlying companies face a similar fate, or at best some form of day-to-day agreement pending solution of the crisis brought on by dilatory tactics on the part of the city in handling its transportation problem.

While the investors in transportation securities thus face a crisis, the car riders of Chicago are also confronted with a serious situation. Under the unification ordinances of 1914, the present operating arrangement was effected, whereby a passenger may travel to any point in the city for a single fare with unlimited free transfer privileges. This arrangement expires simultaneously with the franchise ordinances, and unless some other arrangement is made in the meantime, there is the possibility that the car riders may lose the important advantages of a completely unified system serving the entire city.

The present crisis is in no way attributable to the operating results on the property. Physically, the property is in fine shape. It gives good service and has a substantial degree of public good-will. Its earnings have shown a steady increase, and the combined system carries annually about 850,000,000 passengers. The increase in passengers carried and in gross revenue is running better than 4 per cent above 1925.

The present dilemma in Chicago is the most remarkable example that the industry has yet seen of the situation resulting from the operation of a permanent investment on a fixed-term franchise. Coincident with the expiration of the twenty-year franchises on Jan. 31 next, some $146,000,000 of underlying bonds fall due. Banking interests sponsoring these bonds are unanimous in declaring that financing of new issues cannot satisfactorily be made with a twenty-year franchise term, and at the same time provide the new money necessary for improvements. On the other hand, the Illinois state law does not, at present, permit franchise terms of longer duration.

Subways are demanded which, with extensions and new lines, will require many million dollars of new capital. There is practical unanimity of opinion that the elevated and surface lines systems must be consolidated under one operating company. This alone is a stupendous task.

Two proposed plans of settlement have been submitted to the voters of Chicago and defeated. One attempt to make possible a terminable permit failed in the 1925 Legislature through opposition on the part of the city of Chicago and some down-state interests. The problem thus involves co-ordination of the elevated and surface lines, the state Legislature, the City Council and, above all else, the people of Chicago, in order that the many millions of dollars for extensions and subway development may be obtained.

Regardless of the expiring franchises and underlying mortgages, the Surface Lines group has made steady progress until it is now in its highest state of efficiency. More passengers are carried, more money is earned, more and better service is supplied than ever before. Loop movement has been speeded up by extensive rerouting, eliminating many turns, and the new traffic light installations. One hundred cars have been purchased at a cost of $1,600,000 during the last twelve months, bringing up the total to 445 new cars in about three years. This has made possible the addition of half a billion seat-miles in the same length of time. Yet Chicago today is unprepared with a solution whereby this greatest of all surface line systems may continue to serve except through protection of the court or by some day-to-day agreement that it may effect with the city and the bondholders.

Besides providing operating expenses the car riders have contributed considerably more than $100,000,000 in public benefits during the last twenty years. The $45,000,000 traction fund representing the city share of surplus earned has already been mentioned. In addition street paving has required $16,000,000, maintenance of paving $6,000,000, street cleaning $10,000,000 and general taxes $30,500,000.

Chicago Surface Lines an Operating Organization

To understand the situation in Chicago it is necessary to visualize the financial and corporate structure. The Chicago Surface Lines is an operating organization formed with the passage of the unification ordinances in 1914. The four companies operated under this plan are the Chicago Railways, constituting 58 per cent of the capital value of the entire group; the Chicago City Railway, 34 per cent; the Calumet & South Chicago Railway, 7 per cent, and the Southern Street Railway, 1 per cent.

At the time of the adoption of the present 20-year

Digitized by Google

franchise in 1907 the value of these properties was fixed by appraisal, the companies agreeing to a considerable reduction. Provision was made that additions to the properties should be recognized as additions to capital, thus establishing a definite value at any period which must be considered the purchase price should the city decide to take over the lines. This combined value, as of Jan. 31, 1926, is $163,253,374. It is generally recognized that this is far less than the reproduction value of the properties, which is variously estimated at from $200,000,000 to $250,000,000.

The Chicago Surface Lines operates the four roads as one property, residue receipts being distributed to them after the payment of all expenses in accordance with their shares in the total capital.

The total outstanding bonded indebtedness of the properties is $146,371,275, of which $103,226,275 has been issued by the Chicago Railways, $36,747,000 by the Chicago City Railway and $6,398,000 by the Calumet & South Chicago. All of these bonds mature on Jan. 31, 1927, coincident with the expiration of the franchises. Since the operating agreement establishing the Chicago Surface Lines also expires at that time, steps must be taken not only for the protection of the investment but also for the continuance of unified operation under some new plan or through the extension of the present arrangement.

The Traction Situation Was Thought Settled Twenty Years Ago

With the approval of the 1907 ordinances the people of Chicago felt that their transportation troubles were over. The franchises were hopefully called the settlement ordinances. They were evolved after many years of dickering and discouragement. The disorganized street car systems of the south and north and west sides were brought into co-operation and machinery was set up for the rehabilitation and extension of the properties.

When the settlement ordinances were followed seven years later by the so-called unification ordinance, requiring the operation of the four companies as a transportation unit, the one-city-one-fare idea became a reality.

Like most franchises of twenty years ago, the 1907 ordinances fixed the maximum fare at 5 cents. They required the companies to pave, maintain and clean the part of the streets occupied by the tracks. In addition, 55 per cent of the net receipts (after deducting 5 per cent of valuation) must be paid to the city and set aside in the city treasury as a traction fund to be used for the improvement of transportation or in acquiring the properties for the city.

Relief from the restriction to a 5-cent fare was obtained in 1919 when the Illinois Public Utilities Commission determined that operation could not be continued on the basis of this rate after the War Labor Board had practically doubled wages. A 7-cent maximum was granted. There was some fluctuation between 7 cents and 6 cents until on July 1, 1920, an 8-cent fare was established. This was maintained until June 14, 1922, when an effort of the state commission to restore the 5-cent fare resulted in court procedure. A 7-cent fare, three tokens for 20 cents, has been in effect since that time.

One of the features of the 1907 ordinances which has been most beneficial in stabilizing maintenance and investment of new capital is the Board of Supervising Engineers, a non-political body created by the ordinances for the purpose of administration. The chairman of the board, Col. Bion J. Arnold, was named in the ordinances and the city and companies each selected an engineer to constitute the membership. Colonel Arnold and the engineers who have served with him have been practical men, most helpful in their attitude toward the development of the system.

Many Comprehensive Plans Have Been Made

During at least half the life of the present franchise there has been a series of efforts to work out a comprehensive plan which would provide a unification of surface lines with the elevated lines and make possible the construction of subways throughout the congested area of the city.

The first concrete suggestion with this end in view was made in 1916 by the so-called Parsons-Ridgway Commission, composed of William Barclay Parsons, chairman; Bion J. Arnold and Robert Ridgway, commissioners, and Walter L. Fisher, special counsel. The commission was empowered by a resolution adopted by the City Council "to make a study and report on a unified system of surface, elevated and subway lines." Its elaborate report has been the basis of practically every study made since that time and its recommendations for unification, subways and service at cost are still accepted as the best solution of the local transportation problem in Chicago.

In 1918 the City Council passed an ordinance known as the "new traction ordinance" providing for the development of a transportation system based largely upon the Parsons-Ridgway-Arnold recommendations. This ordinance provided for the unification of surface and elevated lines, the development and extension of rapid transit facilities by the expenditure of some $76,000,000 over a stated period and the extension and improvement of surface line facilities by the expenditure of $2,500,000 per year. It also provided for the construction of a subway through the congested Loop area to take surface cars off the streets. It was based upon service at cost and provided for continuous development.

The proposed ordinance was indorsed by the Chicago Association of Commerce and practically all civic and commercial organizations in the city. It was approved by the Council over the Mayor's veto, but at the referendum election on Nov. 5, 1918, was defeated by a small majority.

This ended traction discussion for a time, but the evident necessity for some solution soon aroused a new interest and the committee on local transportation of the City Council in 1923 instructed Major R. F. Kelker, Jr., consulting engineer, to make a study of the local transportation situation and report on a physical plan for a unified system. Major Kelker's report gave ample statistics on existing facilities and on present and future needs of the city and recommended the consolidation and co-ordination of all transportation lines so as to permit unified operation, the establishment of a single fare on the unified system within the limits of the city with transfers between rapid transit and surface lines, the construction of subways and the expansion of the existing elevated and surface railways. This development was to extend over two periods of construction based upon the relative necessity of the projects.

A new ordinance was framed embodying the prin-

Digitized by Google

ciples of these recommendations. It provided, as did the 1918 ordinance, that control should be vested in a municipal railway board. Municipal notes of indebtedness were to be issued by the city in payment for the properties and for extensions and improvements. These certificates of indebtedness, to be redeemed out of earnings, were to be secured only by the property and were not to be a general obligation on the part of the municipality. Service at cost and an indeterminate permit to operate were features of this ordinance. It was submitted to a vote of the people on April 7, 1925, but, like the 1918 ordinance, was defeated.

Following the defeat of the 1925 proposal the committee on local transportation of the City Council has made considerable effort to develop a new plan. An ordinance was drafted by Francis X. Busch, corporation counsel, at the request of the local transportation committee to serve as a basis for discussion. This draft provides for unification of the properties, for the construction of subways to be paid for in part by special assessment upon adjacent real estate, for an indeterminate permit to be issued by the city, for a city board to take over the duties now exercised by the State Commerce Commission and the operation of the properties on a service-at-cost basis.

Hearings on this proposed ordinance soon developed the fact that it would not only require legislation which must be approved in its entirety by the Illinois General Assembly before the ordinance could become effective but that it contained many features which were objectionable to practical transportation engineers.

Representatives of the transportation companies who had attended hearings on this ordinance were requested to suggest a plan of their own. But it was objected on the part of Henry A. Blair, president of the Chicago Surface Lines, and some others, that until legislation could be secured removing the statutory twenty-year limitation on franchises and permitting unification of elevated and surface line companies it was useless to attempt any adequate solution. Studies are being made, however, with a view to determining exactly what should be asked in the form of legislation.

State Legislation Needed to Effect Solution

Mr. Blair, as early as October, 1924, informed the City Council that it would be impossible to refinance the properties, secure unification and subways and provide the necessary additional capital for extensions and improvements, the latter estimated at about $250,000,000, on the basis of twenty-year franchises. A bill establishing the terminable permit for all utilities in Illinois in lieu of definite term franchises was introduced in the General Assembly in 1925, but largely because of opposition on the part of the city of Chicago and some down-state interests no effort was made to pass it. A legislative commission was created, however, to investigate the operation of the terminable permit in other states and its feasibility in Illinois, and to report to the next General Assembly. This commission has now practically completed its investigation and its report will be made, in all probability, some time in January. It is hoped that the report will embody the draft of a bill providing for some form of terminable permit. It is highly improbable, however, that the necessary legislation will be passed before the expiration of the franchise.

Apparently there is no objection to the substitution of terminable permits for the definite term franchise law, but there is considerable difference of opinion as to whether the permits should be issued by the Illinois Commerce Commission or by the City Council. The Chicago city administration, although agreeing to terminable permits in principle, is on record against any legislation which does not invest the city with the right to issue the permits and to exercise all of the regulatory powers over local utilities now vested in the State Commerce Commission.

Recent Proposals a Further Complication

In the meantime the situation has been complicated by the submission of a proposal by F. J. Lisman & Company to form a company and take over the properties operated by the Chicago Surface Lines without waiting for legislation. Fifty million dollars in new capital would be provided under this plan for extensions and improvements of the Surface Lines. Junior securities would be issued for the outstanding bonded indebtedness on the properties. It is proposed to provide on a service-at-cost basis for the retirement of the $50,000,000 of new capital in the twenty years of the ordinance period, but unless the ordinance period could be extended, no additional capital could be put into the properties and no provision could be made for the retirement of the other securities. Worst of all, from the public policy standpoint, however, the elaborate scheme of unification and subway construction so incessantly demanded throughout the years as the only feasible solution of the problem could not be realized.

The latest development is the proposal of the Chicago Motor Coach Company to substitute buses for street cars upon the expiration of the franchises. Since it contemplates the destruction of these great properties and a wiping out of the entire capital investment it hardly seems possible that the proposal will receive serious consideration. The manifest impossibility of meeting the enormous transportation needs of the city with motor buses alone must be apparent, even to those who would have no compunction in destroying property and shaking the faith of capital in utility investments.

Busy Year for Indiana Public Service Commission

IN THE fiscal year which ended Sept. 30 the Indiana Public Service Commission authorized the issuance of $467,130 of bonds by municipally owned utilities, $45,761,805 of securities for private utilities and $255,628 for other purposes, making a total of $48,484,564. These figures are contained in the annual report of Howell Ellis, secretary of the commission. This total was $24,948,880 less than the total for the previous year. The sale of 197,025 shares of common stock of no par value also was authorized. Total fees collected by the commission in the year amounted to $295,962.

The service department of the commission disposed of 342 adjustment cases. The engineering department in the year made appraisals of utility property totaling $27,929,824, in addition to the appraisals for current securities for sales purposes.

The total expenditures of the commission for the year were $144,355. The appropriation for the commission was $170,000.

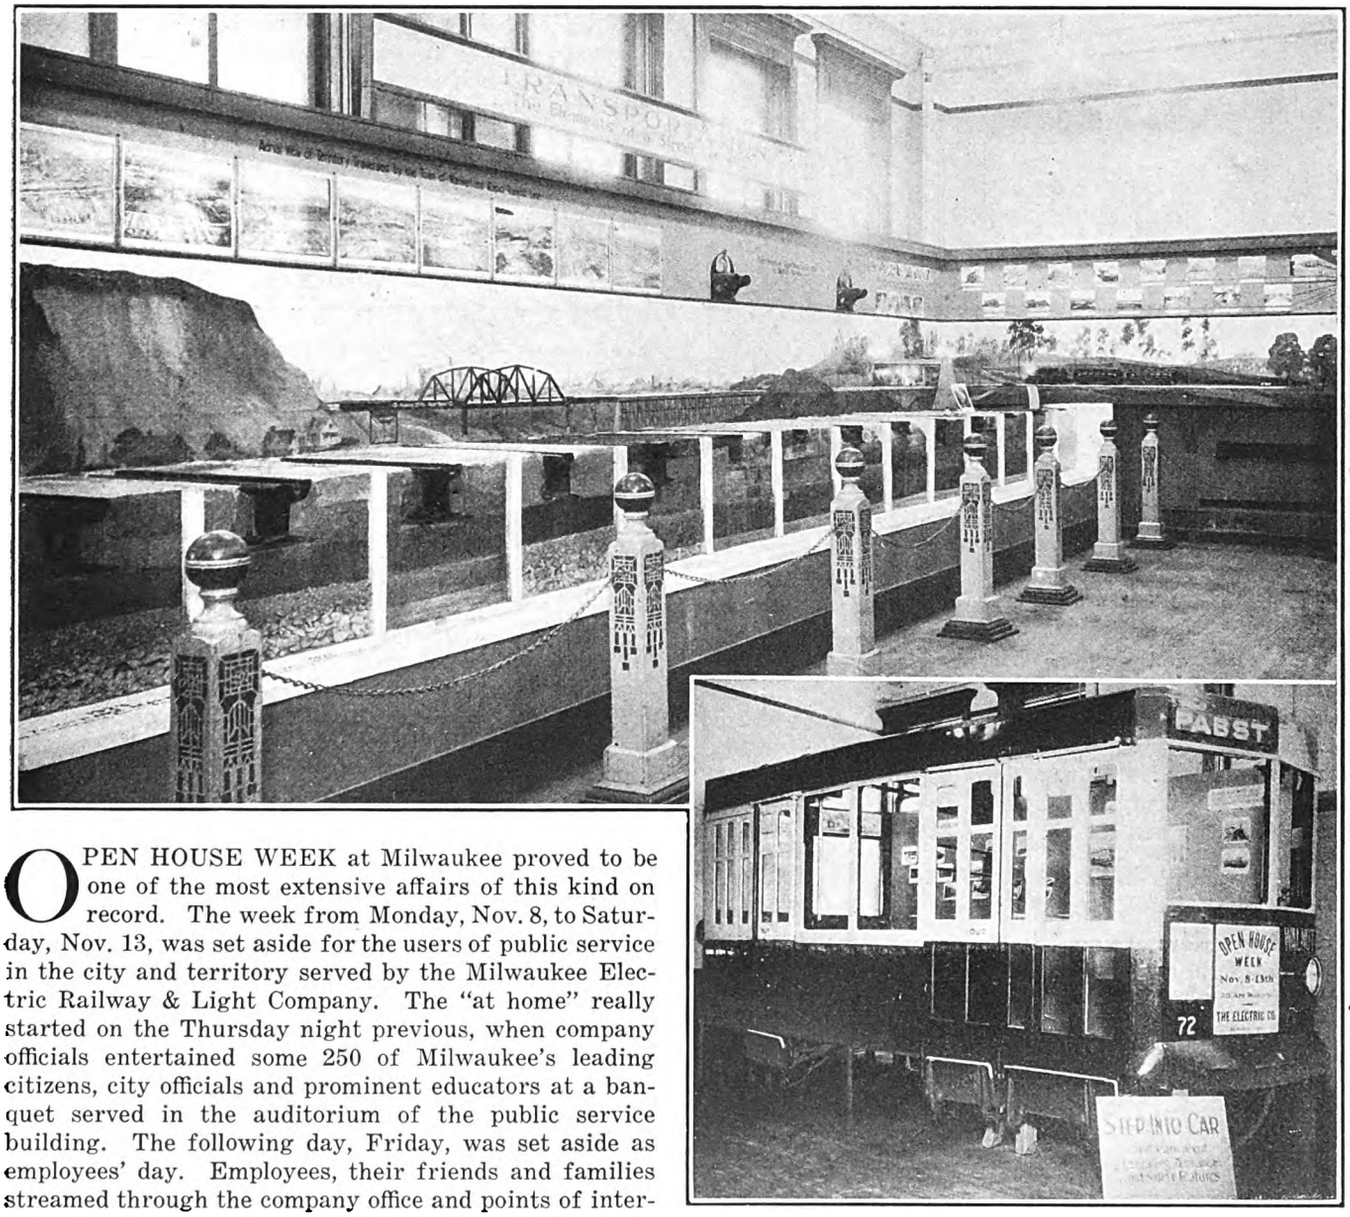
Milwaukee Holds Open House

More than 69,000 People Visited Exhibits of the Milwaukee Electric Railway & Light Company During Open House Week—Among This Number 9,479 of the Company's Stockholders Attended on a Day Set Aside for Them



Some Convincing Demonstrations of Equipment Given to Guests of the Milwaukee Electric Railway & Light Company

In the background of the transportation exhibit (upper view) was a miniature railway train that set in motion signals of various types. In the foreground were sample rail and paving sections showing the heavier construction required for modern day traffic.

One-man operating features (lower view) were explained to the visitors during Milwaukee Open House by means of this life-sized model.

OPEN HOUSE WEEK at Milwaukee proved to be one of the most extensive affairs of this kind on record. The week from Monday, Nov. 8, to Saturday, Nov. 13, was set aside for the users of public service in the city and territory served by the Milwaukee Electric Railway & Light Company. The "at home" really started on the Thursday night previous, when company officials entertained some 250 of Milwaukee's leading citizens, city officials and prominent educators at a banquet served in the auditorium of the public service building. The following day, Friday, was set aside as employees' day. Employees, their friends and families streamed through the company office and points of interest. **On Saturday, by special invitation, 9,479 stockholders of the company came in actual contact with the facilities in which their money was invested and the personnel in charge of operations.**

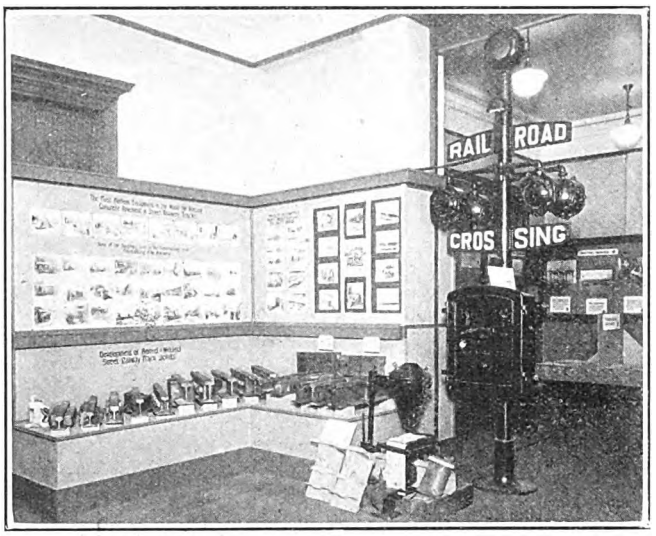
The exhibits were set up in seven different groups, as follows: Public service building, Lake power plant, Cold Springs shops, Oneida steam heating station, substations at eight different locations in the city and suburbs, street car stations at West Allis, Oakland Avenue and Fond du Lac Avenue and the Kinnickinnic bus garage. Features of outstanding importance were the opening of the electrical store and the prepared exhibits at the public service building and the starting on Nov. 6 of the new 1,200-lb. pressure steam boiler and turbine unit at Lakeside station. This turbine delivers 7,000 kw. and exhausts steam at 300 lb. pressure for operating the older steam turbine units. Powdered coal is used to fire this new boiler and the older units as well.

One of the rooms at the public service building was devoted to railway exhibits. A miniature train operated over an extensive track, depicting a portion of an interurban line, set in motion actual block signals and high-

Digitized by Google

way crossing warning units, so that the public could observe the mechanism and operation of each type of signals.

Assembled in a row were typical track and paving sections used at different periods in the history of the electric railway in Milwaukee, all the way from the first rail types, consisting of flat iron bands on wood string-



An Angle on Rail Joints and Track Construction
A corner of Milwaukee's transportation exhibit during Open House Week was devoted to track details. Actual rail joints of various types used on the property were shown as well as photographs of actual track construction.

ers with open track or paving consisting of loose gravel, up to the present 151-lb. grooved and 102-lb. tee rail types in use today. The concrete or brick surfaced paving required under modern day conditions was illustrated in section by looking through the glass end of each sample of track construction. Parts of car equipment were exhibited, opened up to show the interior workings. A complete working section of a one-man car 18 ft. long was set up.

WHERE JIMMIE WORKS

One of the features of particular importance on this property centers around the Employees' Mutual Benefit Association and the educational and other work accomplished by it. The educational department has just been moved to new spacious quarters on the fourth floor of the public service building. In the auditorium on the second floor, used for many E.M.B.A. functions, was shown a recently completed film entitled "Where Jimmie Works."

In this building the medical department is located and its many rooms and laboratories were open to the visitors. Members of the medical staff showed visitors how health is promoted among the employees and their families.

In the "thrift" exhibit it was shown that the employees of the company operate the third largest building and loan association in the State of Wisconsin, with total assets exceeding $7,500,000. Of all the married employees in the company 80 per cent own their own homes.

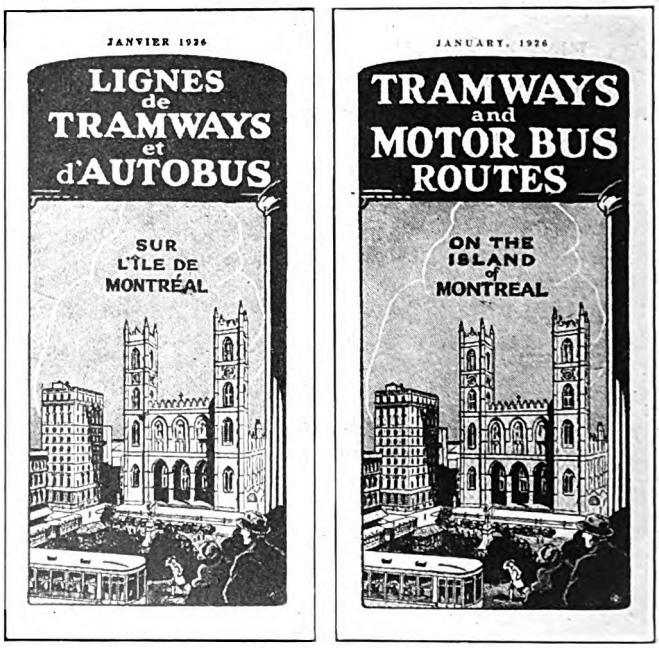
Naturally the Cold Springs shops of the company, representing approximately $1,000,000 of investment, were of interest. Work of car rehabilitation and overhauling was under way and the visitors could see the extensive processes used in the maintenance of equipment. At the Kinnickinnic garage spray cleaning, improved oiling and greasing methods and oil reclaiming processes were demonstrated. The floor type of dynamometer used to give a bus an inside "road test" proved of interest.

In addition to these exhibits the company's substations and carhouses were open to the public, guides being provided to explain their use in providing service.

Of interest to electrical men was the new store for merchandising and servicing electrical appliances. Not only are units displayed, but the method of display, even to the type of show windows, has been worked out, to illustrate the possibilities to store owners in other lines of merchandising. An electrical house is not uncommon nowadays, but in the basement level of this new store is a permanent house completely fitted out in which architects and private home builders may seek advice and have demonstrated not only the most modern electrical equipment but the most modern methods of installation.

How to Get About in Montreal

"LITTLE Lessons for Beginners in French" might well be the cognomen applied to a handy route book just issued by the Montreal Tramway, Montreal, Que. You can take your choice. Pick it up casually and you will perhaps find yourself glancing through a complete outline of the company's tramway and motor bus routes—all purveyed in the most meticulous of English. Turn it over in your hand and again you will find the same information, but this time in fluent French. Phrase by phrase the contents of the "Siamese" booklets are identical, so that neither constituent part of the French-Canadian population may cry "Discrimination!" The larger share of the population of Montreal is of French persuasion. It was decided to carry out this unique idea of a dual booklet in order that the maximum of accommodation might be provided for all users of the tramway and bus lines. In addition to in-



Both Covers of the Montreal Route Guide Are Front Covers

formation regarding the various routes of the company, a number of hints to the traveling public are included on such matters as paying fares, entering and leaving cars, etc. The booklets are furnished free of charge to patrons of the tramway and bus lines.

Mr. Storrs Comments on Conditions in Europe

Managing Director of A.E.R.A. is Struck by Interest in Improved Rolling Stock and by Conviction on Part of European Managers and Public Officials That Complete Co-ordination of all Forms of Public Transport Is Essential to the Public Interest

BASED ON AN INTERVIEW BY
Charles Gordon

IMMEDIATELY following the strenuous work of preparation for the Cleveland convention, Lucius S. Storrs, managing director of the American Electric Railway Association, took a much-needed rest in the form of a brief trip to England, France, Germany and Italy. Although this was primarily for pleasure and rest, he took advantage of the opportunity to look over electric railway properties in the cities which he visited, and brought back a number of comments which should prove of interest to American operating executives.

LUCIUS S. STORRS
Managing Director
American Electric Railway Association

Two primary things stand out from Mr. Storrs' observations. First of these is the conviction that seems to be general throughout Europe that the electric railway continues to offer the best agency for the basic transportation service of modern cities, supplemented of course by the bus in a large measure. Transportation executives both in London and the large cities of continental Europe have not only been giving careful study of the bus in their own and neighboring countries, but have also been watching its development in America through articles in the technical press and by personal trips of inspection to this country. In addition, particularly in London, Paris and Berlin, experience with the bus antedates, in some cases by many years, its extensive introduction in this country.

Having in mind the growing realization on the part of the public and the transportation companies in the United States of the necessity for a complete co-ordination of all means of public transport and the need for a more thorough understanding of the transportation problem on the part of public officials and the people generally, as well as the necessity for better understanding of the public's needs and viewpoint on the part of transportation officials, Mr. Storrs noted particularly the progress which has been made in this direction in Europe. Here he was impressed by the strides which have been taken toward reduction of the waste, congestion and confusion produced by overlapping of transportation agencies and the obstacle to community progress which is caused by failure to consider all forms of public transportation from the standpoint of the community's needs as a whole.

In this instance Mr. Storrs found that we in America are not taking the leading position that we assume we are and on which we flatter ourselves. Throughout Europe there is an almost universal agreement on the need and advantages of co-ordination, and a determined interest by railway executives and public officials to effect such complete co-ordination of all public transport facilities as rapidly as possible, and solely in the public interest. Buses form an important part of the transportation systems, in small as well as large cities. But in each case they are co-ordinated so as not to duplicate in kind the service on rails. In providing service to sections of cities not reached by railways, and on streets where the character of the thoroughfare would make rails undesirable, they are performing useful and efficient service. In such cities as Nice, Genoa, Rome, Florence, Bologna and Munich buses are operated, but they have been co-ordinated with existing rail lines.

As a result of their experience and observations, Mr. Storrs found transportation executives, and city officials as well, convinced that adequate transportation facilities for their cities and the proper co-ordination of buses is dependent on intensive development and modernization of the electric railway systems. To this end extensive programs of improvements are under way, and

Digitized by Google

many experiments are being conducted for the purpose of developing improved forms of rolling stock.

Like all American visitors to Europe, Mr. Storrs was struck by the comparative quietness of foreign rail operations. This he attributes to the high standards of track and equipment maintenance. In comparison with American conditions, he found this to be a point of marked superiority. Operating speeds in Europe, however, he found to be generally lower than in this country, and the introduction of one-man operation has lagged both because of the difficulty of fare collection under the zone system so generally in use and also because of the lower scales of platform wages.

Another feature with which he was impressed was the general adherence to electric braking. He was of the opinion that this increased the weight of motor equipment required and also held back the introduction of air-operated door equipment for inclosed cars. To this he attributed some measure of the responsibility for low schedule speeds.

The progress made in car improvements in Berlin and the extensive program of modernization there was the subject of particular observation and comment. Since the war approximately 25 miles of new rail lines have been built. Introduction of all-spring suspended motors and totally-inclosed bevel gear drive, with the gears immersed in oil, has passed the experimental stage and has been adopted as a definite design practice. He found the management of the Berlin surface car lines enthusiastic over the results obtained with this form of construction and considered the subject of similar improvements, one to which American operators and manufacturers could well afford to give increased attention.

An extensive program of car modernization is already well under way in Berlin. This includes attention to the matters of car appearance and other features to make the service more attractive to riders. A similar appreciation of the advantages of car improvement was evidenced in discussions with railway executives in other cities in continental Europe and in London.

Still another feature of Berlin and Paris practice is the definite commitment to single-deck cars. The management there has become convinced that the double-deck car, while it seems to afford more seats per given unit of street space and track capacity, is so slow in loading and unloading as seriously to cut down schedule speed. The net result is that all traffic is slowed down to an extent which cuts the effective transportation capacity of a given line below that obtained with single-deck equipment, when advantage is taken of modern methods for increasing the speed of passenger interchange.

Mr. Storrs was further impressed by the general use in Europe of anti-friction bearings, and the satisfactory results reported for them. In some cases, experience has extended over a number of years, and in Berlin roller bearings have been adopted as standard for all new equipment. In Paris the practice is to use ball bearings. Approximately 1,000 new cars have been put in service in the German capital, replacing older, heavier and less attractive equipment. These consisted first of four-wheel motor and trail cars, having two axle-mounted motors on one car. These are being changed so that there will be one motor on each car, driving both axles through bevel gears, and with the two cars permanently coupled to permit double end operation. Wheel brakes are being abandoned in favor of clasp shoes on axle disks or armature mounted drums.

In London two new types of double-deck surface cars are being developed with a primary view to increasing schedule speed through the provision of more ample facilities for the rapid interchange of passengers. These cars are also being designed with a view to decreased weight and increased attractiveness through the application of automotive ideas to car design.

Paris, likewise, is giving close study to car development with a view to improving the character of service rendered. In that city and in Berlin the cycle of car design has been similar. Early single-truck cars of short wheel base were followed by double-truck cars of considerably increased weight. The latest practice is in the direction of four-wheel cars of comparatively long wheel base, with oil tight bevel gear drive.

Chicago "Tribune" Defends Safety Island Regulations

COMMENTING editorially on a tour of investigation recently taken by its automobile editor, J. L. Jenkins, the Chicago *Tribune* declares that not one motorist in three pays any attention to safety zone regulations at electric railway loading points. The *Tribune*, which has been conducting a vigorous campaign for many months against the incompetent and careless motorists, pointed out that loading point safety zones have two functions—they protect those boarding or leaving street cars and they speed up motor traffic by permitting automobiles to pass a street car halted to take on or discharge passengers. Drivers are called upon to remember that they are being benefited as well as the pedestrian car rider. The writer continues as follows:

There is no safety in a safety island if motorists disregard the rules. Safety islands are safe only when the law is respected 100 per cent of the time. Otherwise the pedestrian's trustfulness merely exposes him to accident.

Safety islands, in the matter of the faith commonly placed in them, rank with boulevard and through street stop signs and traffic lights. People do not trust in speed laws, in headlight laws, in the rules concerning the passing of vehicles, the crossing of streets, or turning corners. They do, however—drivers and pedestrians—trust in stop signs and lights and in safety islands. Violations of these rules should be prosecuted, accordingly, with the utmost vigor.

The tendency to get away with something does not stop at safety islands. A trip on the boulevards is enough to show that drivers are failing to stop or slow down adequately at stop signs; that some of them habitually sneak through the traffic lights. For cars to start up on the yellow light instead of waiting for the green is an almost universal practice; the man who waits for the green received as his reward a raucous chorus of horns from that particular type of boor behind him.

Ganz Develops Single-Phase, Three-Phase Locomotive

ENGINEERS of the Ganz Works at Budapest are developing a type of electric locomotive capable of taking energy from a high-voltage, single-phase overhead conductor and converting it on the locomotive into low-voltage, three-phase current for use in the motors. Two locomotives of this type have been built for the Austrian Bundesbahn for main line service. They weigh about 80 tons each and are rated at 3,200 hp. capacity. A third locomotive of this type is being tested on a 9½-mile section of the Budapest-Vienna line. The Ganz company has also recently built two 3,500-hp. d.c. locomotives for the Paris-Orleans Railway in France.

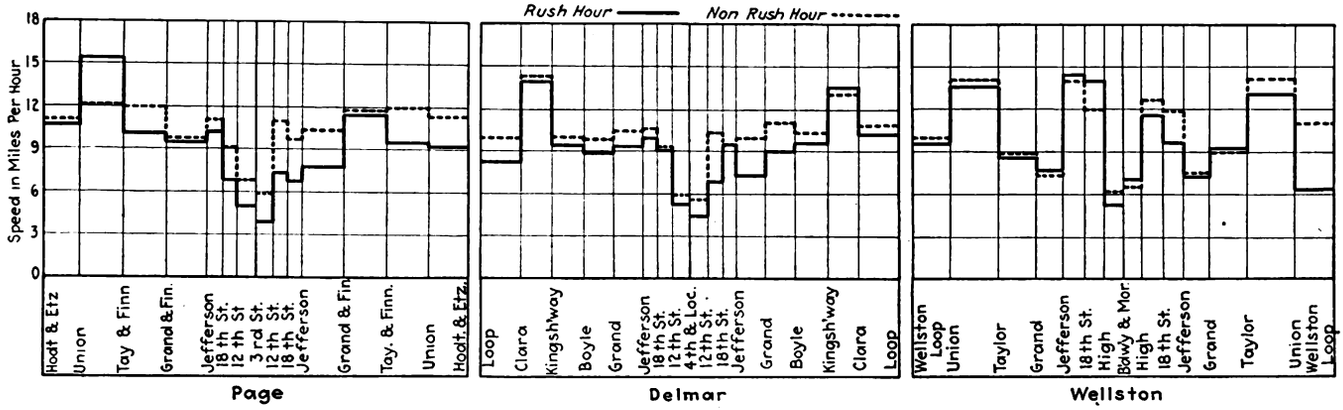
Co-ordinated Transportation Proposed for St. Louis

SECOND ARTICLE

Importance of Higher Car Speeds Stressed and Means Suggested for Gaining Them—Buses Will Not Supplant Electric Cars in Mass Transportation and Are Expensive Substitutes—High Buildings Aid Rather than Impede Better City Transit—Means Outlined for Caring for Future Traffic Needs by Rapid Transit Trains, Buses, Electric Cars and Private Automobiles

IN the issue of Dec. 11 an account was given of the present transportation agencies and transit situation in St. Louis, as outlined in a report prepared for the Board of Aldermen of that city by E. R. Kinsey, president of the Board of Public Service, and C. E. Smith, consulting engineer, St. Louis. The second part of the report analyzes the possibilities of improvement by higher speeds for the surface cars, the use of buses and rapid transit lines and rerouting. An interesting topic considered in this portion of the report is the effect on city transportation of high buildings. While indorsing the principle of decentralization to the extent to which it can be done by the removal outside of the congested center of business or trades which can be transacted as well or better elsewhere, the report declares that transportation problems are simplified when the area of the main business district is kept comparatively small by the erection there of high buildings.

An abstract follows the second part of the report. The first topic considered in this part of the report is car speeds.



Average Speed of Cars on Three Important Radial Lines in St. Louis. The Great Difference between Uptown and Downtown Schedule Speeds Is Very Noticeable

Speed of Street Cars

Before the advent of the automobile, the street car was the fastest means of transportation for use in cities not having rapid transit facilities, and it still is and will continue to be, when properly co-ordinated with bus service, the preferred vehicle for mass transportation. But people are less tolerant of slow motion than ever before and the average of 10 m.p.h. made by the city street cars is no longer attractive. It is noteworthy that the present speed of street cars was reached 25 years ago and has not been increased appreciably since that time. The street car must get in step with the rapidly changing situation and speed up. This can be done in various ways.

In congested business districts where traffic is sufficiently dense to support the investment in underground construction the speed may be raised by running the street cars in subways. But speeds just as fast may be made at much less expenditure on the surface outside of these districts.

Slow Surface Speeds Become Obligatory in Cities

As the districts in which the faster lines are located become built up, the conditions approach those of the slower lines, and the speed will likely decrease. It is necessary for those lines that are paralleled by smooth improved roads on which automobiles and competitive buses may make high speeds to increase their speed. Otherwise the traffic will pass to the fastest means of transport on the public roads.

Car speeds in cities vary from approximately 25 m.p.h. by the express trains of the New York subways down to 3 m.p.h. on the street surface of congested business districts. In St. Louis different speeds are found in various parts of the city under different conditions, as shown in Table I.

Generally speaking, the average car speed in St. Louis is 9½ to 10 m.p.h., while in Cleveland the average speed is 10½ to 11 m.p.h., about 10 per cent faster than in St. Louis. The higher speed in Cleveland is due partly to wider streets and partly to the co-operation of the public, the street railway company and the public

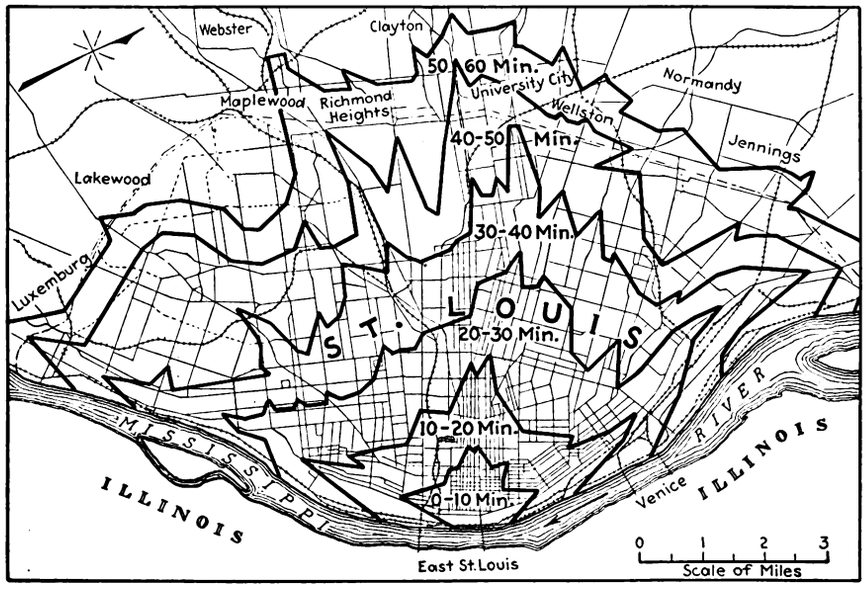
(b) When paved over and used by other traffic	13
Express service on private right-of-way with separated crossings	25

authorities in avoiding unnecessary use of street car space by other traffic. In addition, all streets with car tracks have been made boulevards in Cleveland and other traffic must stop before crossing. Careful planning has been given to street car speeds in Chicago and Detroit.

A great deal of the slowing down, especially in the rush hour, is due to the frequent stops. A great deal of



Present Time Zones from the Business District During the Evening Rush Hour by Existing Means of Communication

St. Louis is subdivided into small blocks, about 16 to the mile. When cars make that many stops the convenience of the greatest number is sacrificed to that of the few who desire to secure street cars by short walks. If the cars made only eight to ten stops per mile the longest distance from the stop measured along the car lines would be 300 ft. The length of the average walk would be increased less than 5 per cent, but the speed of street cars would be materially increased.

The diagram on page 1131 shows the average speed of street cars on three of the principal radial lines entering the business district. The average number of passengers per mile of single track per year for the six years 1920 to 1925 for these three lines were: Delmar, 1,213,000; Wellston, 1,200,000; Grand, 1,097,000. In these diagrams the full lines show the speed during the rush hour and the broken lines the speeds during the non-rush hours. Speeds during the non-rush hours are usually faster, as indicated by the broken lines being above the full lines in almost every case. Where the opposite occurs the cause is due either to light traffic or to cars hurrying to make up time lost in congested districts. In each of these diagrams the outlying ends of the lines are at the extreme right and left of each graph and the downtown portion in the center; that is, each graph shows a round trip. In general, the speed through and approaching the downtown end of the line is less than at the outlying ends. Where tracks are located in reservations of the streets and do not have to mix with the other traffic the speed is from 3 to 4 miles above the average.

The remarkable slowing down of street cars in the congested area causes a great accumulation of cars there during the rush hours.

Another way of showing car speeds is by a time contour map, and such a map, reproduced from the report, is shown. It has been calculated from actual speeds during the evening rush hour, the time being taken from the Federal Reserve Bank at Broadway and Locust Street, and a walking time at the rate of 3 m.p.h. has been allowed. Whenever a transfer from one line to another is made one minute is allowed for the change of cars. It is assumed that the fastest route has been taken in each instance.

A second time contour map is reproduced to show the time zones after the second step of rapid transit construction, recommended later in the report, is taken. It shows a saving of approximately twenty minutes to all parts of the city and that 90 per cent of the city population will be within a 30-minute ride of the center of the city.

MAINTENANCE OF SCHEDULE IMPORTANT

The maintenance of regular schedules is as important as faster speed, but, by reason of interference of other traffic, schedules are easily interrupted. Time checks on busy lines in St. Louis showed that time gaps between cars several times the scheduled headway are quite frequent. To show how great is the variation of the actual speed of the schedule and to show the delays in service car performance charts have been drawn for a number of lines. Such a chart for the Delmar line is given on page 1135. It shows the movement of all cars on the line during the day from 6 a.m. to 10 p.m., the slope of the line indicating the speed of the car between any two points. In this chart, lines with dots indicate two-car trains.

Because of the large number of cars on this line the observers were unable to time cars in both directions at once, and so timed eastbound cars on one day and westbound on the next. This accounts for the fact that the delays do not run across the chart. The worst delay shown was a fifteen-minute tie-up of the eastbound cars between 5 and 6 o'clock in the afternoon. The delay just east of Twelfth Street, due to traffic, frequent loading and unloading points, is clearly shown by the upward slope of the lines at this point.

The establishment of express service by the street cars and local service by buses will speed up the service marvelously. This could be worked out very nicely on the east and west lines and on some of the north and south lines. This bus service for local passengers need not be on the same street as the car line if it made junction with it at the express stops. If the street having the car tracks should be made a boulevard so that all cross traffic would have to stop and give the cars the right of way very good speed could be made.

Another method of increasing the speed of cars is

Digitized by Google

by a thorough revision of the present car routes. In many cases lines can be rerouted, and while still serving each district adequately, the speed of the line can be increased by reducing the number of turnings and crossings. A suggested rerouting plan forms part of the report.

MOTOR BUSES WILL NOT SUPERSEDE STREET CARS

The advent of the motor bus as an agency of mass transportation is the biggest change that has happened in surface transportation in cities since the coming of the electric car 35 years ago. Among men not expert in transportation matters the idea is prevalent that the day of rail transportation in city streets is gone. But men who have made a lifetime study of rapid transportation, including those who have had most experience in operating motor buses, do not share that view. They are firm in their opinion that the motor bus will never successfully handle mass transportation in large cities. This is true except possibly under a system of rapid transit with motor bus feeders and auxiliaries.

The consensus of opinion seems to indicate that there is no place in any city except possibly the few very largest cities for the motor bus in competition with the street railway, because such competition inevitably renders adequate service by the street railway impossible, if it does not actually ruin it, while after the ruin takes place the motor bus cannot handle the load, particularly during the rush-hour peak.

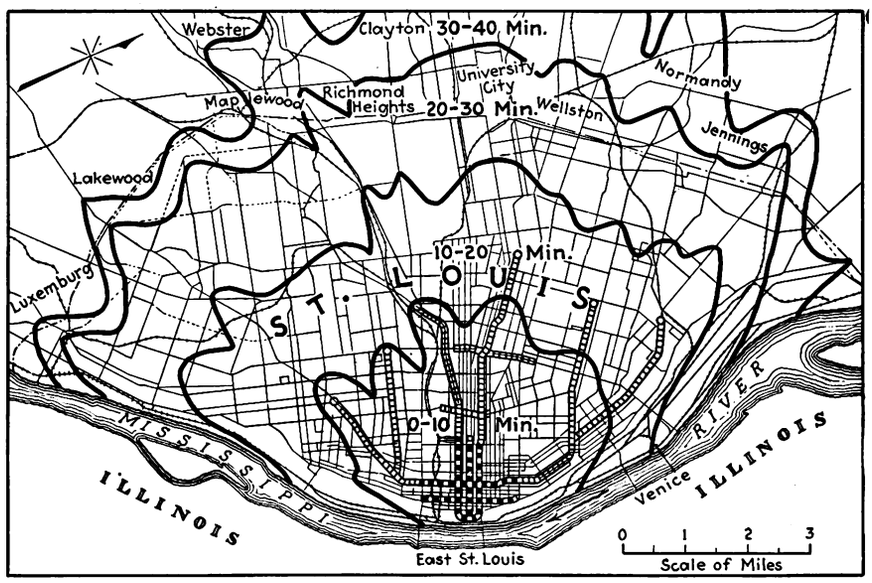
The motor bus, however, can be of inestimable value as an adjunct to the electric railway when accepted in the proper spirit as supplementing rail service and providing a class of transportation that many people desire, even at a higher cost. In cases of this kind they should be provided with that transportation to the extent to which it can be provided at the price they desire to pay for it, but it should be established as a co-ordinated branch of the street railway service and not in competition with it.

It is surprising what a large element of the population, even including men of large affairs and a big business, believes that competition in city transportation is beneficial and tends to reduce cost. Of course it is axiomatic that to the extent to which competition brings about unnecessary duplication of service the cost will be increased, and the inevitable result will be an increase in street car fare. When buses are operated as a parasite on the street railway system, reducing the profits on the profitable lines, the ability of the latter to carry the unprofitable street car lines is reduced to such an extent that fares must be increased or service reduced over the entire street railway system.

DIFFERENCE BETWEEN 7-CENT AND 10-CENT FARE

A sociological question is involved in the difference between a 7-cent street car fare and a 10-cent bus fare. The difference between these two rates means an average increase for transportation of about $50 per year per family. No doubt in any community 5 or 10 per cent of the families can easily absorb such an increase, but the great multitude of the families cannot contemplate or undertake with equanimity an increase of $50 in the family budget. To avoid that, the cheaper means of mass transportation by street cars in the larger cities must be continued with full vigor and at the least cost. This cannot be done if they are subjected to unregulated competition of favored subsidized motor bus lines.

The extent to which motor buses in St. Louis have been favored and subsidized is indicated by the fact that they are permitted to charge a 10-cent fare while the street railways are limited to a 7-cent fare. The street railway company contributes to the city about 12 per cent of its gross revenues in various forms of taxation and paving costs, the motor bus company approximately 4 per cent. The motor bus company is not compelled to provide any particular quantity of service during the rush hour, but is permitted to choose the number of passengers for which it is willing to provide seats; the street railway is compelled to provide a fixed number of seats and a fixed area of standing room for all passengers and carries the burden. The motor buses wear out pavements provided by others; the street car company pays for pavements used by others. There is no obligation on the bus company to continue service on any line.



Time Contours After the Second Step of Rapid Transit Recommended Has Been Made. Here Practically the Entire City Is Within the 30-Minute Time

The speed of the buses on the lines in St. Louis radiating from the primary business district is a little slower than the street cars. The buses average about 9 to 9½ m.p.h., the street cars nearly 10 m.p.h. But because the buses do not run as frequently as the street cars, the longer time spent waiting makes the trip take still longer. The map which appears on page 1136 shows the present street railway and bus lines in St. Louis.

Before the advent of the buses in St. Louis the 7-cent fare of the street railways was adequate, and without bus competition would be more than adequate today. But with the competition, principally because of unnecessary and wasteful duplication of service, neither company is making money. The bus fares cannot be raised. Under present riding conditions it is possible that the street railway company can be made whole by an increase in fare, and if that causes traffic to be diverted to the bus company, possibly both would be

Digitized by Google

TABLE II—SUMMARY OF TRAFFIC COUNT INTO AND OUT OF BUSINESS DISTRICT

	10 A. M. to 4 P. M.			Maximum Hour (P. M. Peak) Leaving District One Way			Entire Business Day 7 A. M. to 6 P. M (Both In and Out)		
	Per Cent of Total		Passengers	Per Cent of Total		Passengers	Per Cent of Total		Passengers
	Vehicles	Passengers	Per Vehicle	Vehicles	Passengers	Per Vehicle	Vehicles	Passengers	Per Vehicle
Street cars	7.5	55.4	28.5	8.3	72.9	73.5	9.6	63.5	32.7
Private automobiles	89.7	36.4	1.6	89.4	20.1	1.9	87.3	28.8	1.6
Buses	2.0	7.9	14.3	1.2	6.4	45.2	1.9	7.2	18.0
Service cars	0.8	0.3	1.5	1.1	0.6	4.4	1.2	0.5	2.2
Total or average	100.0	100.0	3.8	100.0	100.0	8.5	100.0	100.0	4.9

on a better basis. But that step would be a direct penalty of a higher fare against the 90 per cent who ride in street cars in order that 10 per cent may ride the buses at still higher fares.

Notwithstanding the harm that has resulted to the United Railways from motor bus competition, the motor buses have come to stay, and when the unnecessary duplication of routes and service is ironed out the ultimate result will be beneficial.

Motor Buses Are Expensive Substitutes

It might be argued that if electric car lines could be suspended and the entire traffic thrown to the motor bus lines, the latter could succeed. The evidence all seems to indicate that under such conditions the motor bus service would result in higher fares. Having no fixed property there is no assurance of the continuation of all the bus lines, particularly the non-profitable lines. To the extent to which the newer means are justified, they should be adopted by the electric car company.

High Buildings in Primary Business Center Versus Decentralization

Is it better to permit buildings to go to any limit, as in New York, Chicago and most other large cities, or to restrict the height as has been done in Boston for 25 years? The statement has frequently been made that it is impossible to provide transportation for the congested section of Manhattan Island. The real trouble is that transit facilities there have not been provided in pace with other developments and the increased business is served by facilities built for lesser businesses.

For about 25 years Boston has had a stringent law restricting building heights to slightly over 100 ft. This has caused the business district to spread over a large area and apparently has brought into the district many automobiles for transacting business which might not have been needed if business were transacted in a smaller area. There is nothing in the Boston situation that would indicate that the restriction of building heights has ameliorated the traffic congestion there. Quite the contrary may be assumed, for recently the building height restrictions have been raised.

It is worthy of discussion whether traffic congestion is increased more by high buildings than by the increased travel made necessary when business is transacted in smaller buildings spread over a larger area. Certainly the cost of transacting business over a larger area is more expensive and raises the question whether concentrated business or traffic congestion shall control.

To minimize the amount of expensive rapid transit construction in large cities, it does not seem logical to keep the congested districts small and to concentrate the business and improvements there by permitting the maximum number of large buildings.

Decentralization has been suggested by many as one permanent solution of the traffic problem; that is, the development of a number of secondary business districts. This is apparently taking place to a greater extent than ever before, as a study of any large city will show, but there is no indication that it will materially decrease the importance and expansion of the main business center, where most of the congestion troubles are. There is no doubt that decentralization will result in increasing the amount of automobile traffic in the various centers, while at the same time street car travel will also be increased correspondingly, and means will have to be provided to furnish mass transportation among them.

Traffic conditions in the congested centers can be relieved by moving out of them certain lines of business or trade that can be transacted as well or better elsewhere. This has been done with the fruit and produce business in Chicago and has been proposed in New Orleans. It should be done in St. Louis.

With subways into the St. Louis primary business district it would be possible to move several times as many people in and out as are now being moved on street cars, but underground sidewalks would be needed along all streets having subways, and probably along all streets in that district.

Further development of the congested downtown area will depend in part on relief from automobile congestion as well as on the solution of the transit problem. With street cars removed, the streets will be available for trucks, private automobiles and pedestrians. But private automobiles must have somewhere to stand elsewhere than on the streets. Garages contiguous to the edge of the business district will help materially, but when a quarter to a half mile away from one's place of business are not altogether satisfactory. To provide for them, there should be a separate floor in every large building built in congested areas. This is believed preferable to the provisions of large open parking spaces around the edges of the primary business district.

Relation Between Street Car and Automobile Traffic in Congested Districts

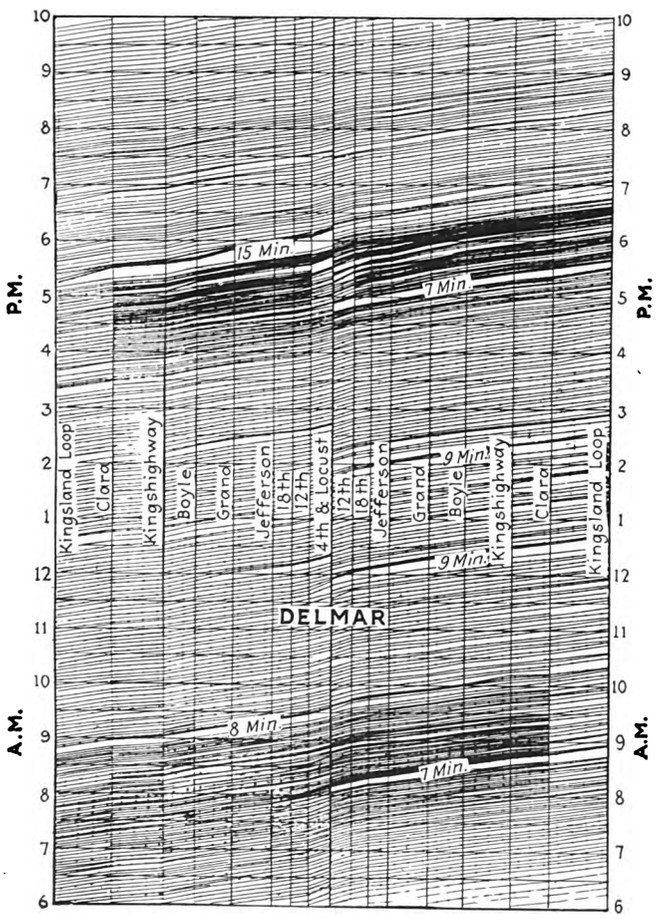
The number of automobiles and automobile passengers entering and leaving the downtown congested district in St. Louis was counted on several normal days during August and September, 1925, in order that a comparison might be made between the occupancy of streets by automobiles, street cars and other traffic and the number of passengers carried by each. Altogether, during the entire business day from 7 a.m. to 6 p.m., 100,509 passenger vehicles and 37,850 commercial vehicles entered or left the business district. Of this number 10,399 passenger vehicles and 2,722 commercial vehicles left the business district during the maximum hour in the afternoon peak. Table II shows the percentages of vehicles during the non-rush hours and afternoon rush hours as well as during the entire day with average number of passengers per vehicle. This table proves that where the bulk of the transportation business at all times is done by the street cars, they carry a greater percentage during the rush hours than during the non-rush hours, and that the motor buses do not carry as large a percentage of the rush-hour traffic as during the remainder of the day.

In other words, the street cars lose most business at

Digitized by Google

times when they have ample capacity to carry it and to furnish seats for every passenger. It is lost during non-rush hours when schedules are at a minimum and headway at a maximum and consequently when service may not be decreased proportionately without further loss. The only possible cure for this is to speed up the service and make it more attractive.

These traffic studies show very decidedly that some remedy to the present situation must be applied if traffic



Running Time Graph of Cars on Delmar Line, Showing Irregularity of Schedules in Morning and Evening Rush Hours in Downtown District

is to be kept moving at all. In the congested district the solution is to place the agency for mass transportation —that is, the street cars—on a separate level of the street, underneath the present level, and in the outsections of the city to place them in reserved strips in the center of boulevards or on separate levels either above or below the present street surface.

Another reason for the separation of traffic is that, although the passengers carried by street cars are greatly in excess of those riding in private automobiles, it must be admitted that in purchasing power and presumably from other standpoints, the automobile riders are of more importance to the primary business district than their numbers would indicate.

Effect on Car Speed of Parked Automobiles—Prohibition of Parking Considered

The survey discloses that the street cars are seriously handicapped in their movements and slowed by the congestion caused by parked automobiles. It does not seem to be a proper use of the streets to permit automobiles, which carry only a small per cent of the public, to occupy the streets so as seriously to interfere with the 60 to 75 per cent of the people who must be carried on street cars. As the survey showed reserve parking capacity outside the congested district, the remedy would seem to be to permit parking for 30 minutes to one hour, and to have parking places convenient for those who want to remain longer or all day. This might lead to each large building assigning the entire basement or an upper floor to automobile parking.

The time consumed by street cars in round-trip routes or through runs through the congested business district was checked with and without parking of automobiles during rush hours.

The first count was taken early in 1925, during which time automobiles were permitted to park at the curb for a period of one hour, and the curb space was always fully occupied during the rush hour. The second count was taken in September, 1925, after regulations had been in effect for several weeks prohibiting all parking within the district between 4:30 and 6 p.m. The regulations were well enforced and the curbs were kept clear of automobiles. The time in minutes spent by all cars in the district was reduced from 264 to 247, a reduction of 6.5 per cent, amounting to a saving of 0.9 minutes per car. The speed in miles per hour was increased from 5.29 to 5.54, an increase of about 4.7 per cent.

Even under the more favorable condition of no parking, the actual speed was about 10 per cent slower than the scheduled speed, due to delay caused by more moving automobiles during the rush hour and to the time spent in taking on passengers.

If it be a fact, as retail merchants have complained, that the complete prohibition of parking has an adverse effect on business, the slight advantage of moving street cars through the districts at an average of one minute faster would not seem to justify irreparably damaging the merchants, and parking during the rush hours might better be continued for their benefit under regulations that would avoid delay to street cars.

Automobiles should not be permitted to park so close together as to delay other traffic when getting to and from the parking space to the curb. This can be accomplished by marking berths for automobiles 5 to 6 ft. longer than the average automobile. This would seem to be preferable to the entire prohibition of parking at any time. On the other hand, there is no justification for all-day parking anywhere in or around congested districts.

Movement of Automobiles on Streets With and Without Car Tracks

A count of automobile traffic in and out of the congested districts shows that the automobile capacity of a street with no car tracks is greater than that of one with car tracks, and other studies indicate that the presence of street cars on any street reduces the capacity of the street for other traffic. This indicates the desirability of concentrating street cars on the fewest possible streets. By doing so, the streets not used by street cars can handle more automobiles at faster speeds, while the avoidance of the street car streets by automobiles—which is possible when adjacent streets are free of street cars—enables the street cars to move faster, due to less interference.

The concentration of street cars on the fewest streets practicable also permits better automatic traffic control to be adopted on those streets without street cars. Street cars in narrow streets in the congested districts cannot be adjusted satisfactorily to automatic traffic

Digitized by Google

control because the loading and unloading of passengers control their "stop and go" periods in an irregular manner that cannot readily be synchronized with automatic signals.

Reservations for Street Cars Outside Congested Districts

Freedom of movement and relief from congestion increase with the width of streets. With 100-ft. widths further improvement may be made by dividing the roadway into three parts and providing a fast right-of-way for street cars, curbed off in the center, and one-way roadways on each side. This will provide for the separation of vehicles at different speeds, the faster automobiles close to the street car curbing, slower moving vehicles next and cars parked at the curb. On streets of sufficient width, where car tracks are located in reservations and where the density of traffic is sufficient, street cars may be operated express and local

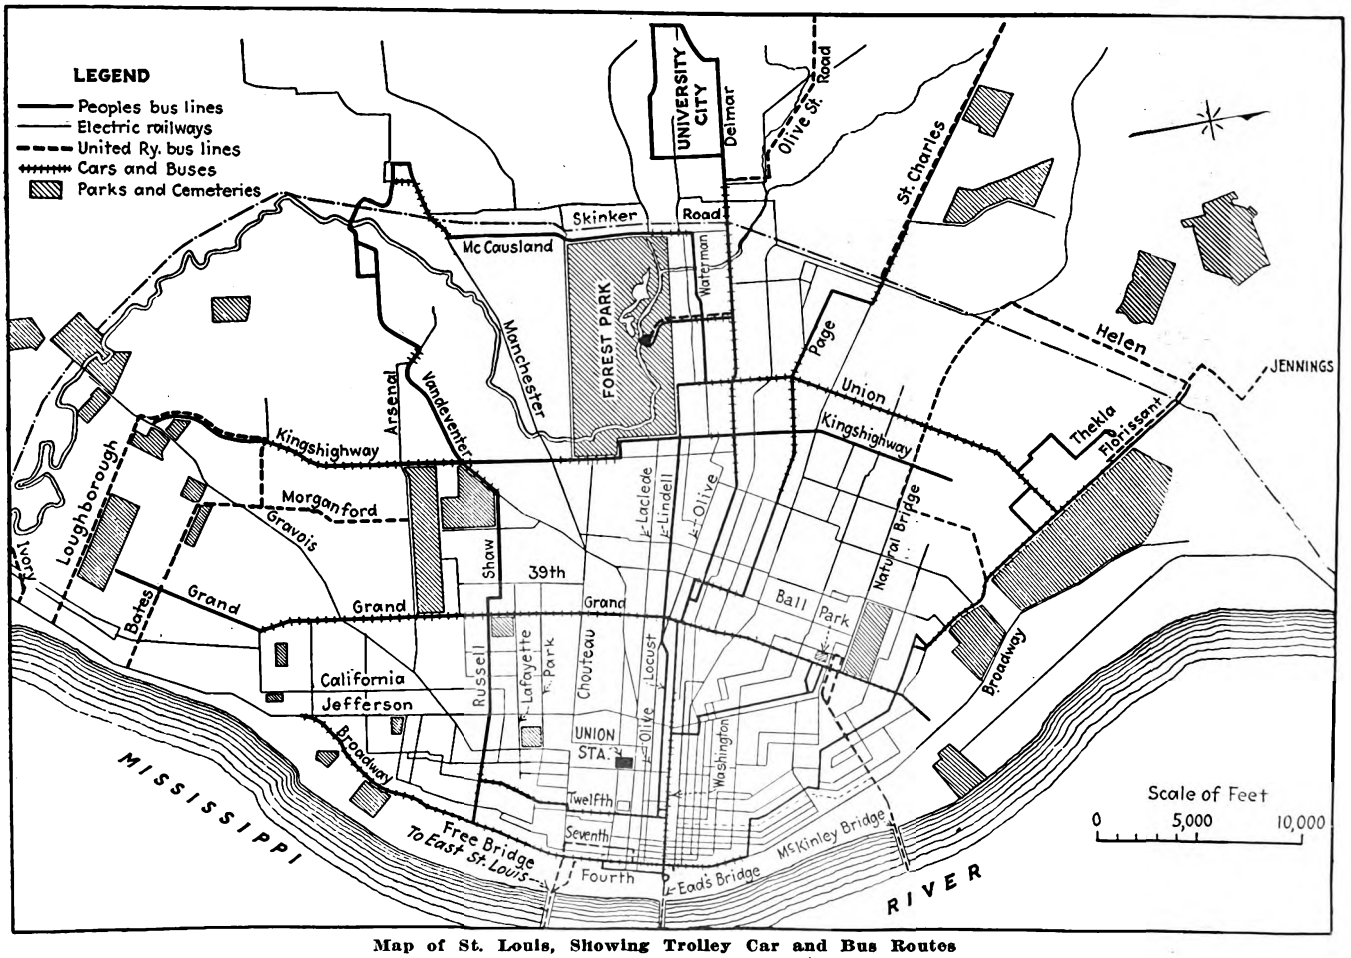
Use as few streets as possible so as to free others of car tracks in favor of automobile use.

Assemble car lines in a manner that will permit their deflection into downtown surface car subways when built, with the least rearrangement.

Loop east and west lines as far east as possible and loop north and south lines through streets as far east as possible. The latter plan offsets in part at least the tendency of business in St. Louis to drift westward and has the additional advantage that the north-and-south lines cross the east-and-west lines where traffic is lightest. Loops and turns in the business districts should be kept at a minimum and left-hand turns eliminated as far as possible.

Proposed Rapid Transit Lines

It is recommended that the first step in the construction of rapid transit facilities in St. Louis be the building of street car subways in the congested districts, as



Map of St. Louis, Showing Trolley Car and Bus Routes

service rendered by buses interchanging passengers with the street cars at important intersections, as already explained. As street car riders constitute about 75 per cent of the traveling public, there is every reason why at least one-third of the roadway should be assigned exclusively to them on streets that are wide enough.

Rerouting

The rerouting of street railway lines in St. Louis in the past has been handicapped by the requirements of old franchises and mortgage obligations, which it is expected will be virtually wiped out by the present financial reorganization and a new modern franchise. In such rerouting the following policies should be kept in mind under St. Louis conditions:

shown by the heavier check lines in the time contour map for the future on page 1133. These subways should be built near the surface of the street, especially at stations. They will be of steel and concrete and contain two tracks. Parallel underground sidewalks should be built in the subways as part of the structure. Each subway will take up nearly the entire width of the 60-ft. street and the stations and underground sidewalks will have to be built inside the property line. These subways will be built for surface cars in the first instance, but will be so designed that when extended in the future they may be used by rapid transit trains.

Such a plan would have notable advantages over a single rapid transit line, such as one through the city from east to west. Such a route would stimulate fur-

Digitized by Google

ther intensive development along a narrow strip, whereas the plan proposed would not favor any one section of the city to the disadvantage of the others and would solve the entire street car delay problem in the congested districts. Thus, by improving the service equally to all sections, it would encourage the orderly utilization of all undeveloped areas within the city. Finally, cars used in the rush hours, to the number of 200, could be stored during the day at the riverfront instead of making return trips practically empty. This would amount to a saving of 2,000 car-miles per day.

The riverfront property between Washington Avenue, the levee, Market Street and First Street would be developed by the construction of a plaza with three track levels. On the first floor, a safe distance above the flood height of the river, would be the rails used by the Olive Street cars. On the second floor would be the Market Street cars and the elevated railroad tracks on the levee. On the third floor would be the Washington Avenue cars, about level with the railroad tracks on the Eads bridge. The roof of this building would be level with the upper or highway deck of the Eads bridge and should be connected with it and finished as a riverfront plaza.

Second Step in Rapid Transit Plan

In the second step of the rapid transit plan trains would carry practically all the heavy traffic. The lines would extend radially from the primary business district to various points, conveniently located for the assembling and distribution of passengers in such a way that the rapid transit lines would be assured of traffic sufficiently dense to justify their cost. These rapid transit lines would handle the business of several street car lines and the street cars would no longer handle the crowds downtown. The suggested routes are shown by the lighter check lines in the map on page 1133. The third and final step would consist of extending the rapid transit lines to the city limits and would involve a system with 28 miles of lines. When this step is completed the city limits would be only twenty minutes from downtown during the rush hours, instead of about one hour as at the present time.

It is expected that the first and second steps, involving the expenditure of $36,000,000, could be completed and in operation within five or six years. This sum is exclusive of about $12,000,000 for tracks, electrical equipment and cars for the operation of the line. This sum would be supplied by the operating company, unless the city should decide to finance this cost.

The time when the third step would have to be undertaken will depend on further developments, following the completion of the second step. The third step comprises 28 miles of line and its estimated cost is $52,000,000.

In the second and third steps it is contemplated that passengers wlll transfer between street cars or buses and the rapid transit lines. This would be necessary, as only a small part of the people would be within convenient walking distance of the rapid transit line. Regular transfer across a platform under cover, or in some cases at different levels, is recommended. This plan has been followed for more than 25 years in Boston and for nearly twenty years in Philadelphia with great satisfaction.

The outlying ends of the six rapid transit lines during the second step, and also after the third step, will be important transfer points and secondary business centers. At these points automobile parking space should be provided at nominal cost for people who prefer their own automobiles to street cars or buses beyond the rapid transit lines but desire the benefit of the latter. These parking areas will further decrease the parking problem downtown.

The 7½ miles of line proposed in the first step are in congested streets and subways are necessary, but the lines proposed in the second and third steps may be either subways or elevated.

"Trolley Bargain Day" in Toledo

Co-operation with Railway and Merchandising Officials on Store's Anniversary Results in Profits for Both—Checks Show Trolley Way the Best Way

"SORRY, madam, we can't accept any fare this trip. Your ride is free, by compliments of New Milner's Anniversary Sale." Such Chesterfieldian greetings to railway and bus patrons of the Community Traction Company, Toledo, Ohio, found neither unyielding nor unprepared riders, as "trolley bargain day" on Oct. 15 had been avidly awaited. For had not all citizens devoured the extravagant street car posters announcing the gala event and all true shoppers and housewives scanned the front page news stories with promises of free rides and half prices? Who among Toledo's

Replica of Free Ticket Presented by Passengers Homeward Bound Whose Store Purchases Were in Excess of $1

womanhood would miss an opportunity to "save with safety at New Milner's"?

This merchandising act, new in the history of Toledo, honored the occasion of the first anniversary of the New Milner's store, the largest department store in Toledo. Under the plan formulated by James A. Greig, sales manager of the Community Traction Company, New Milner's purchased the entire inbound business of the company between the hours of 9 and 10 on the morning of Oct. 15, during which time the fare boxes were covered with canvas hoods. But that's only half of the story. The store also offered each customer who made a purchase of $1 or more a free ticket good for one return or outbound ride. The only restriction on this free return ride ticket was that it had to be used before 4 p.m. on that day. This reservation was interpolated to avoid shopping in rush hours, thus throwing the entire burden of the special transportation stunt into the off-peak hours. The outbound ride ticket was festive looking in its yellow, black and red coloring.

Whatever this advertising stunt revealed in the way of business acumen and efficient management, it also was evidence of the deep appreciation which New Milner's felt for the residents of Toledo who had given their patronage so faithfully during the past year. To the store's executives, a fitting way to express such

Digitized by Google

thanks seemed to be found in an appeal to the ladies—free transportation with an opportunity afforded to acquire Axminster rugs, Jap rose toilet soap and black satin charmeuse at specially reduced prices.

In the hectic rush to buy there were some quiescent moments when perhaps the name of the late W. L. Milner was mentioned. He it was who first conceived the idea of the store before G. W. Kidwell, W. P. Emery and Carr Whipple assumed the management a year ago. Oddly enough, this man Milner was also interested in transportation, an evidence of which was noted in his heading a commission which drafted and sponsored the service-at-cost franchise under which the Community Traction lines are operating. His association with both transportation and merchandising endeavors added a certain glamor to this occasion.

But whatever the reasons, the realization of this "trolley bargain day" soared above the anticipation, for when the feverish excitement had died down and emergency policemen had retraced their steps to quieter walks of the city there was still something to shout about, for New Milner's "sale of deeds, not of years" had found many willing buyers and had boosted the trolley way as the ideal way.

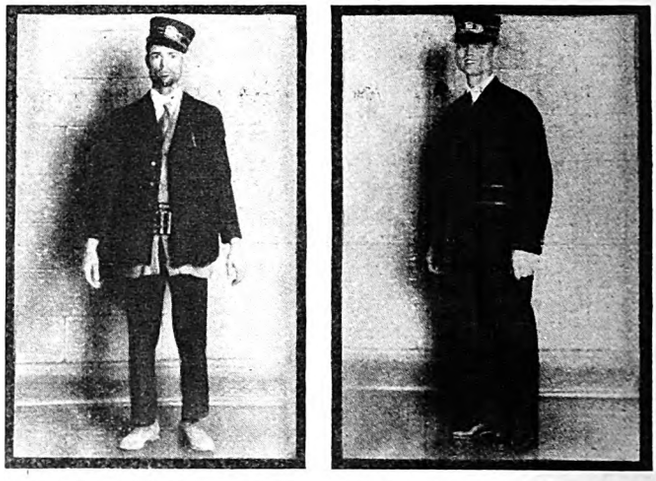
After arriving at the reasonable charge for the leasing of the railway system the amount of normal riding was multiplied by two, as it was presumed the free car ride feature would attract greatly increased patronage. This forecast proved accurate as special service was required on several lines to handle the general increase in riding. In addition, many interesting disclosures were made in this hour of wholesale riding.

Checks made by the Community Traction Company showed that 91 per cent of all persons getting off street cars at the corner of Jefferson and Summit Streets went directly to Milner's store during the special hour between 9 and 10 o'clock. This compared with 20 per cent who went there the preceding Friday at the same time. The total number of persons getting off at that corner during the hour was six times as great as on the previous Friday, and 54 per cent of all passengers riding on Summit Street got off at that intersection. Another tally showed that 1,746 persons entered the store during the special hour, as against 292 persons at the same time the preceding Friday. Unloadings at other important merchandising corners also showed a decrease of 32 per cent compared with the preceding week's checks. On Oct. 16 the check of coupons turned in showed approximately 1,800 issued by the store. An analysis made by the traction company also indicated to the store the exact neighborhoods from which the bulk of its business was attracted. These figures were furnished to the store heads and the results indicated that most of the riders in that hour were Milner's-bound.

"The results exceeded our most optimistic predictions," announced Carr Whipple, executive of the store, following the day's sale. "Certainly the results are a definite proof of the fact that Toledo citizens appreciated the courtesy." More effusive was J. Frank Johnson, vice-president and general manager of the railway, who said that Toledo could well be proud of the distinction that the whole enterprise was an indication of what could be accomplished by real co-operation. "Department stores have long recognized the fact that the great majority of their patronage comes by street car," Mr. Johnson continued, "but this is the first time that a definite check, showing just how much this patronage amounts to, will be available." He added that the results would be closely followed not only by the railway management but by Milner's also.

And now it is being bruited about that Milner's and the Community Traction will—yes—repeat the "trolley bargain day." Meanwhile other department stores in the city are making anxious inquiries on the cost of such service.

A Story Without Words



EFFECTIVE contrast, as shown in the accompanying picture, was recently used by the Utah Light & Traction Company to teach its platform men the desirability of neatness in personal appearance as a means of cultivating the good will of the company's patrons. An impressive story, without words, was told by the poster containing these pictures, of large size, displayed prominently in the trainmen's quarters at the carhouses in Salt Lake City.

Statistics of Interstate Electric Railways

DURING the early part of December, 1926, the Bureau of Statistics of the Interstate Commerce Commission made public its annual schedule of statistics of electric railway companies doing an interstate business. Altogether there are 260 electric railway companies which report to the Interstate Commerce Commission. The largest, in total operating revenue during the year, was the Pacific Electric Railway of Los Angeles, which reported revenues from freight of $5,947,157 and from passengers $12,592,345, making a total operating revenue of $19,514,325.

STATISTICS OF INTERSTATE ELECTRIC RAILWAYS FOR YEAR ENDED DEC. 31, 1925

	Eastern District	Southern District	Western District	Total
Number of roads	172	8	80	260
Miles of roads operated	8,099	467	5,509	14,074
Investment in road and equipment	$806,205,351	$41,865,505	$628,717,637	$1,476,788,493
Freight revenue	15,214,009	2,538,851	21,249,684	39,002,544
Total operating revenues	104,926,687	5,373,939	97,145,412	207,466,038
Total operating expenses	84,969,411	4,018,124	79,758,924	168,746,459
Operating income	28,847,731	1,261,116	18,012,467	48,121,314
Net income	5,067,125	(d) 35,569	8,948,648	13,980,204

(d) Deficit.

Some of the aggregate figures of the Interstate Commerce Commission are given in the accompanying table. The statistics as published give data for each of the 260 companies listed, as well as aggregate figures.

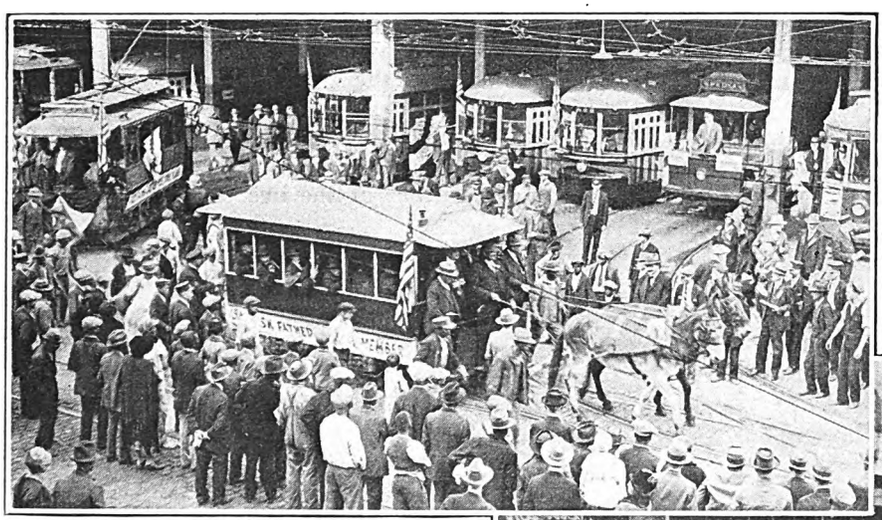
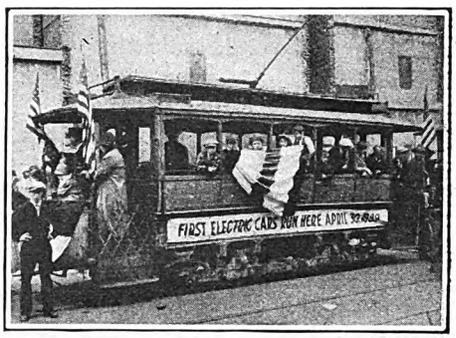
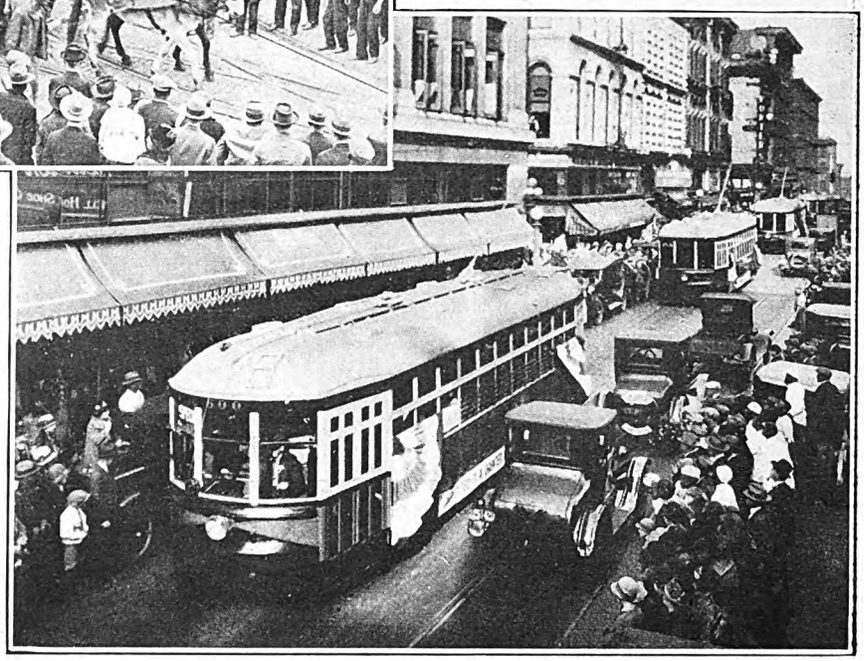
Nashville Celebrates the Arrival of New Cars

Historic Pageant Calls Out Large Crowds—Latest Cars of Modern Type Named After Ten Distinguished Citizens of the State

NEW cars, ten in all, each named after a distinguished citizen of Tennessee, have been added to the rolling stock of the Nashville Railway & Light Company. To celebrate their initial trip, the company held a historical pageant on Oct. 29, with a number of earlier types in line, including the first mule car and the first electric car operated in Nashville. The mule car represented the form of transit begun in Nashville in 1866 and the electric car that in 1889. Later types of cars followed in the procession and finally the new cars, gleaming in bright colors.







Nashville Citizens Reviewing the Progress of Urban Transportation from Mule to Motor

As passengers the new cars carried as guests of honor 500 representative citizens of Nashville, including the Mayor, other city officials, delegates from civic clubs, historians and editors. After a trip through the business district and other parts of the city they returned to a central point, where J. P. W. Brown, vice-president of the company, formally presented ten small models of these cars to Mayor Howse as indicative of their dedication to public service.

Special interest was taken in the mule car, and on the following Sunday it was exhibited on the downtown streets of Nashville to a crowd of approximately 5,000 persons.

Among the Tennesseeans for whom the new cars are named are three former presidents of the United States, Andrew Jackson, James K. Polk and Andrew Johnson. David Crockett and Samuel Houston are names borne by two other cars. A feature of historic interest in the procession was that the car "Andrew Jackson," which led all of the other new cars, bore a fine gold sword which had been presented to "Old Hickory" in Nashville more than 100 years ago. It had been loaned for the occasion from "The Hermitage," Jackson's old home near Nashville.

The city press gave a great deal of space to the parade and the lessons taught by it. One of the newspapers described the crowd as "the largest in downtown streets since the citizen troops came home from France." Another, the *Tennesseean,* said editorially: "It is a fine thing occasionally to have our attention dramatically and forcefully drawn to the rapid evolution of transportation or something else which plays a vital part in our every-day life. We then appreciate more fully the fact that the blessings, the comforts and the conveniences which we enjoy today, and we are unquestionably living in the world's best age, are not ours by mere chance. They are ours because men of prophetic vision, of dauntless courage and of intelligently directed enthusiasm have been willing to labor and to risk that we might enjoy them."

Metallic Emblems Identify Inspectors

INSPECTORS of the Union Street Railway, New Bedford, Mass., are now provided with metallic emblems of gold plate and red enamel worn on the coat lapel. The new insignia is quite distinctive and does not tarnish or fray as was the case with the braided monogram formerly used. The new badges of authority met with the heartiest approval of the men.

Tucson Buses Make Profit

Fare Is 2 Cents Higher than That of Street Cars—Bus Patronage Has Been Drawn from the Private Automobile Rather than from the Railway

OFFICIALS of the Tucson Rapid Transit Company, Tucson, Ariz., are enthusiastic over the outcome of the first year's operation of buses. Revenue and expense figures compiled by the company show a small net profit. During the twelve months the buses have been in operation the street car traffic has shown a slight decrease. The loss on the railway, however, has been much smaller than the total number of the bus passengers carried, indicating that a large part of the present traffic has been drawn from the private automobile.

Operation of buses by this railway was begun in the fall of 1925 with the purchase of an existing route from a private concern. Seldom had more than 100 passengers a day been carried on this line. When the company took over the equipment and operation it started an additional line and there was an immediate jump in the number of passengers. Approximately 250 passengers were carried the first day. There are now three lines in operation using four buses in regular service with a fifth in reserve for emergency. On peak days as many as 900 passengers have been carried. Garford and Graham 21-passenger buses are used. Each bus averages 300 miles a day.

In Tucson Five Buses of 21-Passenger Capacity Operated on Three Routes Supplement the Rail Service of the Tucson Rapid Transit Company

Typical Advertisement Distributed with Bills to Light and Gas Customers

BUSES HAVE OBTAINED RIDERS THE STREET CARS DID NOT

In advertising the bus service, the management has been careful to do nothing and say nothing that would detract from the popularity of the street car. Bus operation has been inaugurated to serve the city better without the addition of more trackage and to get business that the street cars were not getting. The principal arguments used for riding the buses have been that they save time and eliminate the difficulty of parking private automobiles. The new service has been advertised in the local newspaper and from time to time on handbills distributed to the public. Occasionally the company prepares an advertisement and distributes it as an insert with the bills sent out to electric light and gas customers. A typical example of this advertising used is shown in an accompanying illustration.

Bus stops have been marked in an unusual and effective manner. At every corner where the buses stop for passengers a yellow band has been painted around some convenient electric light pole. The width of the band is sufficient to make it easily visible at a considerable distance. On this yellow background the bus schedule has been painted in black, as well as an arrow indicating the direction of the route. Thus a person can come to the corner, look at his watch, then at the schedule painted on the pole and know exactly how long he must wait in order to get his bus. The company has stressed the importance of keeping close to schedule and seldom is a bus more than a minute off schedule.

For the convenience of the bus passengers a vacant building at the intersection of the two busiest downtown streets has been turned into a waiting room. Comfortable chairs are provided. This facility is particularly appreciated in summer, as there is no other shade in the vicinity and the street temperatures are frequently high.

Bus fares are 10 cents as compared with 8 cents on street cars. A passenger may transfer from a bus to a street car without paying additional fare, while to transfer from the car to the bus the passenger pays 2 cents. Bus tickets may be bought in packages of twelve for $1. These tickets are on sale at a number of downtown drug and grocery stores. Dealers handle the tickets without cost to the company, as they find that this brings additional customers into their stores. To simplify bookkeeping each dealer is advanced one packet of twelve tickets. Additional packets are paid for as drawn. For example, if a new dealer wanted a half dozen packages he would pay the company $5 and owe $1. Thus he remains one package to the good as long as he handles the tickets. Making it convenient for the public to buy bus tickets has had an important bearing in encouraging traffic.

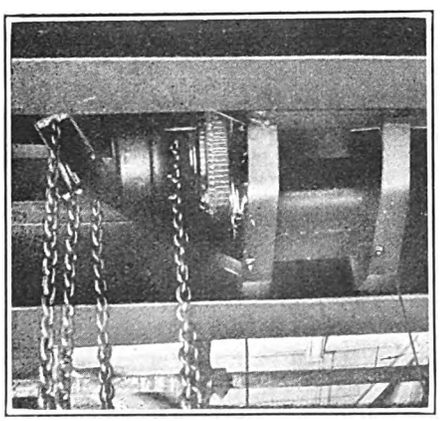
Maintenance Notes

Hand-Operated Chain Hoist Made Motor-Operated

HAND-OPERATED chain hoists with traveling crane carriage have been converted into motor-operated hoists in the shop of the Lackawanna & Wyoming Valley Railroad, Scranton, Pa., at a comparatively small expense. This has been



Hoist, Air Compressor, Driving Chain and Motor Control Ropes in Motor-Operated Hoist

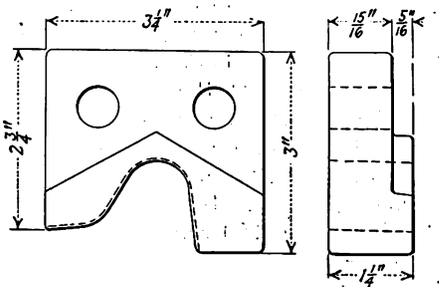
accomplished by machining off the rim of the hand chain wheel and installing a suitable gear rim on this surface. An air compressor motor with pinion installed in a cradle rigidly fastened to the carriage drives the hoist by means of a chain belt. A dial switch installed on the carriage and operated from the floor by means of ropes controls the direction of rotation of the motor.

"Watch your steps."
Keep them in good repair as a safety first measure.

Tool for Turning Wheel Flanges

SO AS to speed up the work of wheel turning in the shops of the Olean, Bradford & Salamanca Railway, Olean, N. Y., a wheel flange tool was developed to cut the flange and part of the tread in one operation. This consists of a flat piece of tool steel about 3 in. x 2¾ in. x 1¼ in. at the wide end and ⅛ in. at the narrow end. The tool is ground carefully to give the proper contour to the flange and has sufficient backlash to obtain proper cutting edges and permit of sharpening. The portion of the tool containing the cutting edges is considerably thicker than the rest to allow sufficient stock for sharpening. Suitable holes are provided to allow for solid installation in the tool support.

The wheels to be turned are mounted in the wheel lathe in the usual manner. The tool is fed against the flange, cutting it to size and at the same time removing a portion of the tread to a depth to correspond to the new flange. The balance of the tread is turned with a flat tool. This tool has afforded a means for a considerable increase in production with a corresponding reduction in turning expenses.



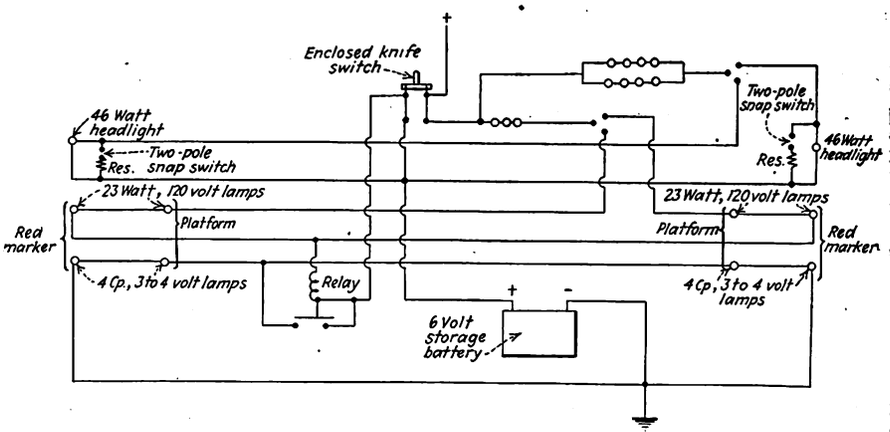
Tool Used by the Olean, Bradford & Salamanca Railway

Rear End and Emergency Lighting Prove Economical

STUDY of the problems from all angles resulted in the Harrisburg Railways, Harrisburg, Pa., installing a combination line and battery electric emergency lighting and rear lamp system for the purposes of assuring continuity of service, promoting greater safety and reducing maintenance expenses.

Heretofore oil lamps were used for rear protection. This involved continual daily maintenance expense in collection, distribution and trimming labor. Again, when the power service was interrupted, the car was in total darkness, causing some passengers to become uneasy. To obviate these objectionable features an electrical installation was made whereby the oil rear lamps were replaced by electric lamps operated from the trolley circuit. In addition a storage battery equipment was installed to permit of lighting the front and rear red dash lamps and platform lamps in case of power interruption.

The equipment consists essentially of two Electric Service Supplies Company's relays and suitable switches, also lamps mounted on either dash, each being equipped with a 120-volt railway type lamp and a 3 to 4-volt lamp and a 6-volt, 100-amp.-hr. Philadelphia Storage Battery Company's battery. All of this apparatus is located conveniently for inspection and maintenance. A



Wiring Diagram Showing Electrical Connections for Headlights, Emergency and Rear Light Installation

Digitized by Google

4-cp., 3 to 4-volt lamp is installed on either platform and in series with a similar lamp placed in the dash lamps directly behind the 120-volt lamp lighted from the trolley. This series connection permits of an immediate detection of a failure. The storage battery is connected to the end of the car lighting circuit so that it is charged continually, thereby greatly reducing battery maintenance. Transfer of the rear lamps from the 600-volt series circuit to the 6-volt battery circuit is accomplished by means of an automatic relay which completes the battery circuit when the 600-volt source is interrupted.

This arrangement assures rear end protection at all times, whether the 600-volt power is operative or inoperative, thereby greatly reducing the possibility of rear end collision and at the same time minimizing passenger panic due to darkened cars. It also protects both ends of the car with red lights when the 600-volt power is inoperative.

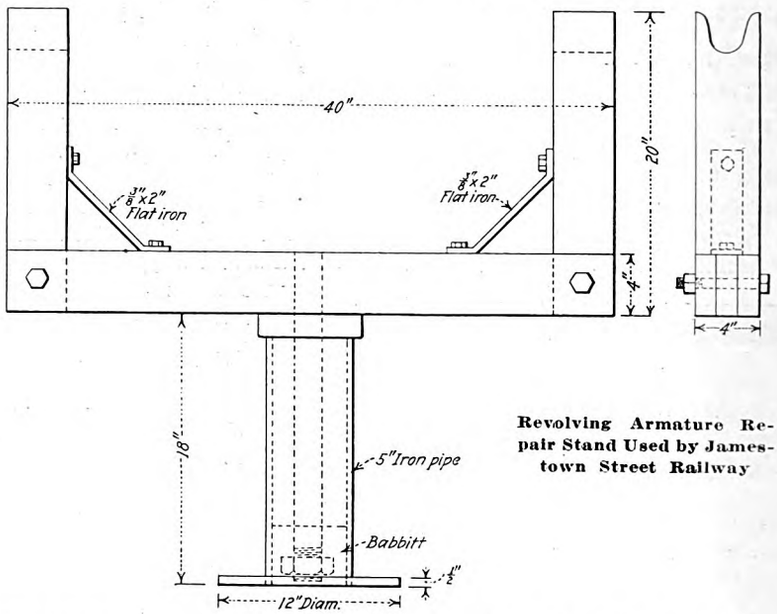
This equipment has cost about $75 per car to install, but the maintenance saving effected by abolishing the oil lamps has already paid for the installation and permitted of a very substantial profit.

Concrete Ties for City Trackwork

REINFORCED concrete ties may be used successfully in street track construction in the opinion of engineers of the Los Angeles Railway. This opinion is somewhat substantiated by the condition of a large number of such ties which have been recently removed from South Broadway between First and Twelfth Streets, a heavy traffic section, after fifteen years of service. The cause of removal was the failure of the rail fastening. In this case a square spike had been driven in a piece of pipe imbedded in the concrete. Corrosion loosened the hold of the spike in the pipe and this, combined with corrosion of the tie plate, also cast in the tie, caused the rails to loosen.

With these difficulties eliminated, which is planned in future ties of this construction, it is believed that a tie will be obtained which will have indefinite life.

Revolving Armature Repair Stand

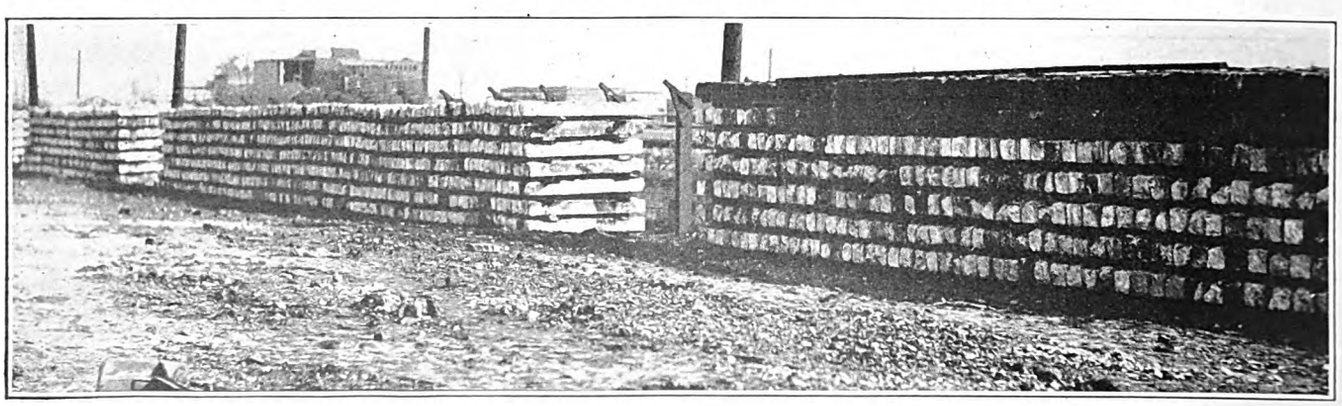


Revolving Armature Repair Stand Used by Jamestown Street Railway

PROVISION has been made for the maximum of daylight on the part of an armature undergoing repairs in the shop of the Jamestown Street Railway, Jamestown, N. Y., by the design and construction of a revolving armature repair stand.

The armature room is surrounded on three sides by a brick wall, so that the daylight working conditions are not of the best. With a non-revolving type of armature repair stand, it was necessary to perform the greater portion of the work by means of artificial light, which in a great many instances was found to be very unsatisfactory. The revolving stand consists essentially of two independent parts, a pedestal and an armature cradle. The pedestal is made of a 5-in. iron pipe about 18 in. long, fastened to a ½-in. steel plate of 12 in. diameter. A 1-in. round rod is passed through the center of this pipe and the bottom fitted with a nut and all securely babbitted in the base of the pipe. The upper part of the rod, held in position by passing through a drilled cap screwed onto the top of the pipe, projects about 4½ in. above.

The cradle is made of 4-in. x 4-in. oak timbers about 20 in. high and 40 in. long. The uprights are recessed to act as bearings for the armature. They are braced to the horizontal section by means of ⅜-in. x 2-in. flat bar. A 1 1/16-in. hole bored in the center of the bottom beam of the cradle slips over the 1-in. iron rod projection on the pedestal. This permits of free movement.



Reinforced Concrete Ties Removed After Fifteen Years Service by the Los Angeles Railway Because of Failure of Rail Fastening. Experiments Are Being Conducted with Similarly Constructed Ties with Difficulties of the Early Tie Eliminated

Digitized by Google

This stand allows the turning of the armature to any angle desired to obtain the maximum of daylight. It can be dismantled readily or stored away when desired.

New Equipment Available

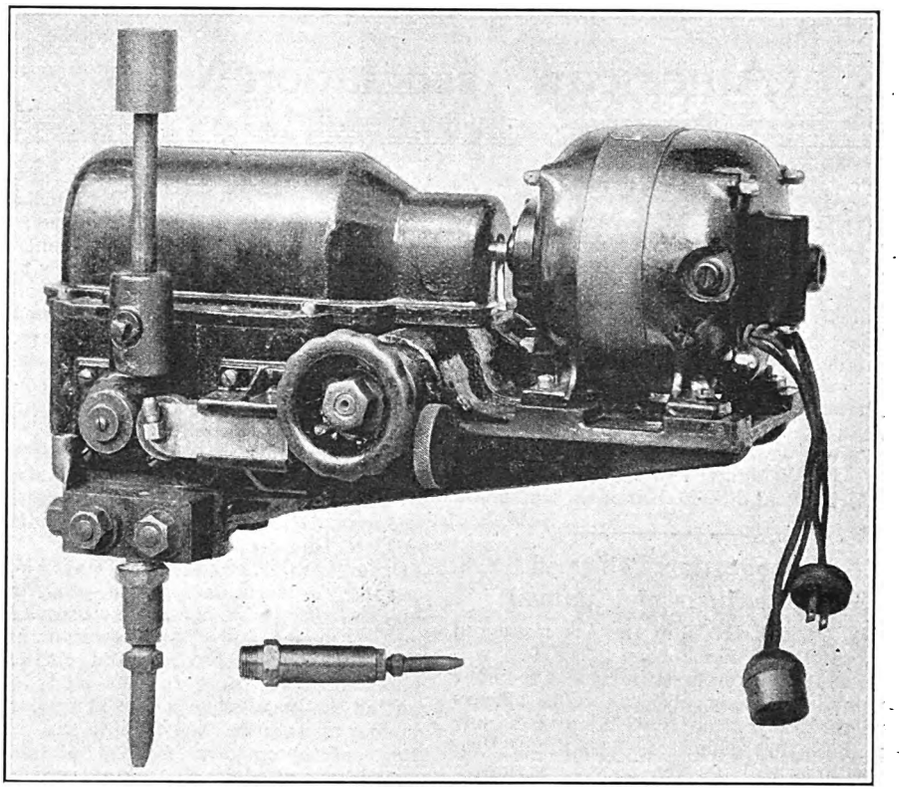
Automatic Welder Speeds Accurate Work

WELDS can be made with great smoothness, speed and accuracy, it is stated, through the use of an automatic welder introduced by the General Electric Company, Schenectady, N. Y. With this equipment, the operator needs but to push a button to start, without any further effort or skill on his part, the sequence of operations which produces the weld.

The new welder starts the arc first by touching the electrode to the work and then withdrawing it. Thereafter a constant arc length is maintained by feeding the electrode wire to the weld at the exact rate of speed necessary to replace the metal fused into the weld. It is claimed that the new equipment will perform these operations more rapidly and with a greater degree of accuracy than is possible by the most expert hand operators.

The automatic welding head incorporates the necessary mechanism for feeding the electrode to the arc and consists essentially of a pair of feed rollers geared to a constant speed motor through a magnetic clutch. The gearing and feed mechanism are contained in one housing to which the motor is bolted.

The rollers feed the welding wire through the nozzle to the arc. The distance and pressure between these rollers is adjustable. Each welding head is equipped with a set of nozzles for $\frac{3}{32}$-in., $\frac{1}{8}$-in., $\frac{5}{32}$-in., $\frac{7}{16}$-in. and $\frac{1}{4}$-in. wire. The speed of wire feed may be adjusted by means of a selective gear changer which adapts the speed of the feed rollers to the size of wire and welding current used. Three gear speed changes can be made. An additional finer adjustment can be made by means of a rheostat in the field of the motor. Provision is made for pointing the electrode backward or forward in the line of weld by rotating the head on its horizontal shaft and for moving it sideways by means of the handwheel on the front of the head.



Typical Automatic Arc Welding Head

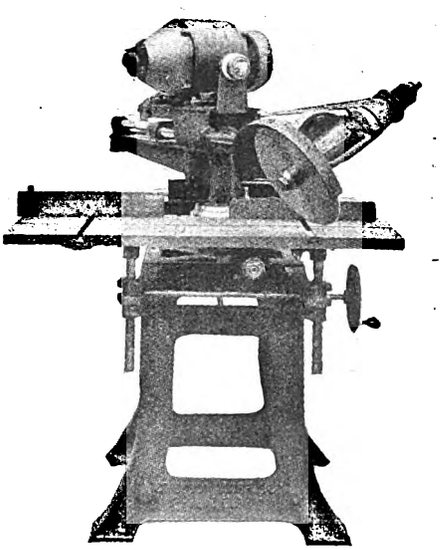
The control equipment consists of a control panel, a meter panel and a push-button station. The control panel mounts the main line contactor for the welding circuit and two smaller contactors for interlocking the travel motor with the arc. By means of auxiliary contacts, the line contactor controls the starting and stopping of the feed motor. The magnetic clutch is operated forward or backward by a voltage relay, the coil of which is connected across the arc. Thus the electrode is fed to or from the work automatically, adjusting itself to any irregularities in the surface of the work. One rheostat controls the speed of the feed motor and the other controls the voltage setting of the arc.

The automatic arc welder will be sold either separately (where the user constructs his own clamps) or as part of a complete welding equipment, including the necessary clamps and framework for holding the work.

Improvements in Wood-Working Machine

SEVERAL interesting improvements have been incorporated in the 20th Century Wood Worker as manufactured by the Cresson-Morris Company, Philadelphia, Pa. A tilting head has been added which makes it possible to cut at a double angle. The rip saw works through an improved cast-iron table, which also serves as an operating table in cross-cutting. The tilting cast-iron fence guide can be adjusted to any angle, thus making possible accurate work.

A new boring attachment and operating table are now standard equipment with this machine. High-speed boring and drilling can be done by using the large belt with which the machine is provided. A special V-shaped belt is also furnished for use in boring when reduced speed is needed.



The New Tilting Head Makes a Double-Angle Cut Possible

American Association News

Service Betterment

SUBJECTS to be considered during the ensuing year were discussed at a meeting of the committee on service betterment, held at association headquarters, New York City, on Dec. 16. The general topics which will be studied include traffic control, speeding up service, employee courtesy, frequency of service, car design, and acceleration and braking. Members present were C. D. Smith, F. J. Denny, W. J. Flickenger, E. A. Palmer, J. C. Thirlwall and S. E. Emmons, chairman.

New Publication Policy on 1926 Proceedings and Manual

PROCEEDINGS of the American and affiliated associations for 1926 will be available for distribution to member companies early in 1927. The officers of the association have adopted a new policy—that copies of the Annual Proceedings will be sent only to members requesting them. Each company and associate member is entitled to a complete set of the Annual Proceedings and a reasonable number of extra copies without charge. Individual members are entitled to one copy of the Proceedings of the association with which they are affiliated.

The 1926 edition of the Engineering Manual will also be available shortly after the Annual Proceedings are off the press. This will be the second bound edition of the Manual, which is now published every third year, and it will contain all of the revisions and additions made in 1924, 1925 and 1926. The first edition of the Manual contained 1,030 pages. Since that time there have been 700 pages of additional specifications and revisions.

Executive Secretary J. W. Welsh is addressing all members, requesting them to inform him before Jan. 1, 1927, regarding the number of volumes of the Proceedings and of the Engineering Manual which they will require in order to determine the number to be printed.

Purchases and Stores Committee Outlines Work for the Year

SO FAR REACHING is the subject of properly disposing of unused, inactive material that President Durie of the American Electric Railway Engineering Association formally authorized the committee on purchases and stores to co-operate with the purchasing and storeroom accounting committee of the National Electric Light Association in studying the various problems involved. On Dec. 6 the committee on purchases and stores invited members of the N.E.L.A. group to join with it in a meeting at association headquarters in New York City.

Discussion of the subject of particular interest to both groups divulged the facts that the establishment of a bureau to handle the unused materials would involve a rather large expense and that it would have to do a business of $250,000 a year to justify its existence; further, it would meet with considerable opposition from independent dealers in the field. It was also developed that if the plan were to be put into operation on a larger and broader scale, the assessments to member companies would be excessive.

A sub-committee of the committee on purchases and stores was appointed to continue the study of and make recommendations regarding the disposal of this type of material.

Other subjects considered at this meeting, in formulating the program for next year, were the review of existing Purchases and Stores sections of the manual for revisions and corrections; the need for a further study of routine methods to be followed in purchasing and stores departments and the study of a uniform method of distributing materials by supply trains and trucks; a uniform system for inspecting and testing materials, with a view to recommending what classes of materials are to be inspected and tested at the factories and what classes at the point of receipt. Sub-committees were appointed to handle these various phases of the year's work.

The meeting was attended by the following committee members: J. Fleming, chairman, presiding; J. Y. Bayliss, A. C. Duncan, A. L. Fischer, B. W. Forkner, A. E. Hatton, W. E. Scott, W. J. Walker.

Representing the purchasing and storeroom accounting committee of the N.E.L.A. were: E. S. Brock, chairman; D. A. Truax, E. M. Burbank, G. W. Young, C. A. Harris, K. C. Campbell, A. Ziegler, Lewis A. Jones, W. F. Stevens.

Special Bulletins Available

FOLLOWING is a list of special reports prepared by the Bureau of Information and Service of the American Electric Railway Association. They are available to member companies upon request:

Bulletin No. 115. *Wages of Employees Other Than Trainmen.*—This gives for about 230 companies a classification of employees and the wages paid each class in the shop, carhouse, way and structures, car, overhead line, stores and bus maintenance and garage departments. It also gives the number of hours worked weekly, the average weekly wages earned, overtime rates and number of employees in each department.

Bulletin No. 116. *Effect of Fare Changes on Revenues and Riding Habit.*—A group of companies having had two or more fare changes has been selected and a detailed record of their revenue passengers and passenger revenues month by month before and after the date of the fare change, has been compiled. The average daily number of passengers carried and the average daily passenger revenue under each rate of fare is compared, and there is also shown a comparison of the percentage of revenue passengers using transfers and reduced rate tickets under each rate of fare.

Bulletin No. 117. *Analysis of Electric Railway Franchises, Part II.*—This is an identical analysis of twelve recently granted franchises under the following main subjects: General Terms, Public Control, Fares, Regulation of Service, Finances, Capitalization and Accounts, Regulations Governing Company's Use of Streets. Part II covers the last four subjects mentioned.

In addition to the above the following supplements have been prepared, bringing the information they cover down to December 1, 1926:

Supplement No. 15 to City and Interurban Fare Bulletins Nos. 41 and 42.
Supplement No. 2 to Bulletin No. 108, Wages of Trainmen.
Supplement No. 2 to Bulletin No. 109, Wages of Busmen.
Cost of Living Studies (Bulletin No. 118).

Kentucky Meeting Postponed

DUE to a conflict of dates the Kentucky Association of Public Utilities will hold its annual meeting Feb. 18 and 19 instead of in January as previously scheduled. Headquarters will be at the Brown Hotel, where the first session will convene on the afternoon of the 18th at 2 p.m.; following the meeting on this day, will be held a banquet and dance. The second session will open at 9 o'clock the following morning.

W. H. Sawyer, president of the American Electric Railway Association, will be one of the principal speakers.

COMING MEETINGS OF *Electric Railway and Allied Associations*

Jan. 6-7—Midwest Electric Railway Association, midwinter meeting, Mayo Hotel, Tulsa, Okla.

Jan. 7—American Electric Railway Association, Metropolitan Section, Engineering Societies Building, New York City, 8 p.m.

Jan. 10-14—American Road Builders' Association, convention and road show, Coliseum, Chicago, Ill.

Feb. 18-19—Kentucky Association of Public Utilities, annual convention, Brown Hotel, Louisville, Ky.

Jan. 19-20—Central Electric Traffic Association, Fort Wayne, Ind.

Jan. 21-22—Central Electric Railway Accountants' Association, Fort Wayne, Ind.

Jan. 25—New York Electric Railway Association, winter meeting. Hotel Commodore, New York City.

Jan. 26-28—Association of Equipment Men—Southern Properties—Memphis, Tenn.

Feb. 3-4—Central Electric Railway Association, winter meeting, Toledo, O., Commodore Perry Hotel.

Feb. 7-10—American Institute of Electrical Engineers, annual convention, Engineering Societies Building, New York City.

Feb. 10—Central Electric Railway Master Mechanics' Association, Toledo, Ohio.

Oct. 3-7, 1927—American Electric Railway Association, annual convention, Public Auditorium, Cleveland, Ohio.

The News of the Industry

Dayton One-Man Car Ordinance Unconstitutional

In an opinion handed down recently the United States Circuit Court of Appeals affirmed the decision of Federal Judge Hickenlooper that the city ordinance of Dayton, Ohio, prohibiting the operation of one-man street cars was unconstitutional. The city of Dayton had appealed from this decree, which enjoined the enforcement of the ordinance. On Dec. 14, 1921, the City Council of Dayton passed an ordinance authorizing the installation of the one-man type of car. Later, in 1923, agitation was promoted by representatives of organized labor for the repeal of the ordinance. On Nov. 6, 1923, the first ordinance was repealed and the new law was passed providing a fine of $35 a day for each car manned by a motorman alone. Appeal was taken from this on the ground that it was unconstitutional and a violation of the Fourteenth Amendment in taking away property without due process of law.

Open House a Success in Wisconsin

More than 90,000 persons were shown through 62 public utility plants and offices in 27 cities during the open house show conducted recently by public service companies in Wisconsin, according to a report made by John N. Cadby, executive secretary of the Wisconsin Utilities Association. Mr. Cadby said that since this was the first attempt to hold a state-wide open house exhibition in Wisconsin the public response was highly gratifying. Approximately 4,500 in. of newspaper advertising space was used in the daily and weekly newspapers by the different companies to acquaint the people with the attractions offered in the open house show. By far the largest share of this advertising was prepared by the Wisconsin Public Utility Information Bureau. Most of the success of the exhibition is attributed to this concentrated advertising program. The conduct of the Milwaukee open house show is described elsewhere in this issue.

Mitten Management Makes Good Bank's Losses

Mitten Management, Philadelphia, Pa., has been enabled to fulfill its promise to restore to depositors of the defunct Producers' & Consumers' Bank the full amount of their original deposits. This fact is disclosed in a statement announcing that $175,612 is now credited to the individual accounts of 1,168 depositors of the former Producers' & Consumers' Bank, who accepted the Mitten reorganization plan for straightening out the financial affairs of the bank. The losses of the Producers' & Consumers' depositors, the statement pointed out, have been made up, not out of the profits of the new Mitten bank, but by direct contribution of $175,612 from Mitten Management funds.

The statement made two other interesting announcements. One was that the Christmas issue of *Service Talk* would have something to say regarding the prospects of repayment to the Producers' & Consumers' stockholders "who went along with Mitten in the Mitten Men & Management Bank." The other was that the Mitten Men & Management Bank & Trust Company, which succeeded the Producers' & Consumers' Bank, will move into its new bank building on Jan. 1, 1927.

Changes in New York Regulatory Plan

New Public Service Department Is Created to Be Headed by Chairman of Present Public Service Commission—Will Take Over Public Service and Transit Commissions

NOBODY at Albany seems to know exactly what effect the reorganization of the state government into eighteen departments or groups will have upon the administration of the two bodies now functioning under the provisions of the public service commission law.

On Jan. 1, 1927, a complete change in the administrative structure of the government of New York State will go into effect under the provisions of what is known as the new "state departments law," passed by the Legislature of 1926. Originally advocated by the Constitutional Convention of 1915, this reform was successfully brought about as a part of the program of Governor Smith to increase efficiency in the operation of government. Under the provisions of such law, the Governor will have control over sixteen out of the eighteen groups of governmental machinery.

The experts who drafted the structural law to effectuate the reorganization scheme claim that after Jan. 1 the Public Service Commission and the Transit Commission will continue to function exactly as they have done in the past so far as the regulation of the affairs of public utilities is concerned, and that the only change will be in the physical description of the two bodies. A serious question arises as to whether, in an attempt to consolidate two quasi-judicial bodies under one head and at the same time preserve their individual entity, the effectiveness with which either or both bodies may function may not be impaired.

The new law, which is included in Article 16 of the state departments law, says:

> There shall be in the state government a department of public service. The chairman of the public service commission shall be the head of such department and when acting in such capacity shall be known as the chairman of the department of public service. . . . There shall be in the department of public service a division to be known as the state division and a division to be known as the metropolitan division.

The new law then provides that

> The head of the state division shall be a public service commission, to consist of five commissioners, who shall be appointed by the Governor, etc. A commissioner to be designated as chairman in his appointment as such commissioner shall be chairman of the commission until his term as commissioner expires.
>
> The head of the metropolitan division shall be a transit commission, to consist of three commissioners, who shall be appointed by the Governor, by and with the advice and consent of the Senate, for terms of nine years each. A commissioner designated by the Governor shall, during his term of office, be the chairman of the commission.

It is provided in the law that

> The state division, by the public service commission and commissioners, shall have, exercise and perform the jurisdiction, supervision, functions, powers and duties of the public service commission and commissioners, as prescribed by law when this article takes effect.
>
> The metropolitan division, by the transit commission and commissioners, shall have, exercise and perform the jurisdiction, supervision, functions, powers and duties of the transit commission and commissioners, as provided by law when this article takes effect.

This much of the new law is entirely plain. The next section, however, states:

> The head of the department (Department of Public Service) shall be the chief executive officer thereof (chairman of the Public Service Commission). The appointment or removal of all officers, clerks, inspectors, experts and employees of the department or of any division thereof, and all contracts for special service, shall be subject to his approval. The organization of the existing office of the public service commission is continued as the organization of the state division, and the organization of the existing office of the transit commission is continued as the organization of the metropolitan division, except as provided by this article or otherwise by law.

Read literally, this apparently means that the chairman of the Department of Public Service, who is the head of the state division in relation to the regulation of utility corporations, will have the power to hire, discharge, fix the compensation of the employees and must approve all of the payrolls and other vouchers calling for the expenditure of money of both the state division and the metropolitan division.

He has nothing to say about the personnel of the membership of the metropolitan division, neither does he have any voice in their acts in relation to the regulation of utility corporations.

The metropolitan division; that is,

Digitized by Google

the Transit Commission, is supported, in so far as the payment of its employees is concerned, by funds appropriated by the city of New York, so that under the provisions of the new law, if its literal conception be correct, the head of the state division, also the head of the two divisions combined, will be approving the payment of moneys out of funds belonging to the city of New York, as well as the salaries of the commissioners of the metropolitan division, an extremely weird legal situation.

More Moves Contemplated

Governor Smith in a letter addressed to Hon. Walter W. Westall, chairman of the State Reorganization Commission, pointed out on Dec. 20 certain apparent defects in the reorganization plan which becomes effective Jan. 1, and has proposed certain legislative changes. In reference to the Public Service Commission and the Transit Commission, the Governor has this to say:

> In my detailed recommendations you will note that I recommend that these two commissions be combined as contemplated by the constitution and that the head of the department be a single public service commission. If this is not done and the anomalous arrangement in the present state departments law remains, then the functions of the two divisions of the department which are semi-judicial in nature and their decisions in such matters should not be subject to the approval of the chairman of the department.
>
> I believe that the structure for the department of public service set up by the state departments law is unconstitutional, unwise and wholly contrary to sound, administrative practice. Under the present law the department consists of two practically independent divisions, but in order to have a nominal head of the department so as to conform to the letter of the constitution, it is provided that the chairman of one of the divisions shall for purposes of controlling appointments and salaries be the head of the department. This is no real department head and the arrangement can only lead to friction and trouble within a department whose real functions are regulative and judicial. There should be one Public Service Commission at the head of the Department of Public Service and this Public Service Commission should have charge of all of the functions given to the state division and to the metropolitan division in the present law. The chairman of the Public Service Commission should carry out the administrative policies determined by the commission.
>
> By reason of an imminent vacancy in the Public Service Commission the time is now opportune for the consolidation of the so-called metropolitan division and the state division into one commission consisting of seven members, leaving the present incumbents and existing terms just as they are, and providing that the state division chairman shall be the chairman of the commission. I therefore recommend to you that you consolidate the two divisions, abolish the position which is about to become vacant and that you leave the internal organization of the department to be worked out by the commission.
>
> With reference to the public service and public works departments, I strongly recommend that you define more clearly and logically the relative functions of these departments as to grade crossing eliminations. I believe that outside of New York City these eliminations should be initiated and all engineering plans and supervision not intrusted to the railroads should be in charge of the Public Works Department. The Public Service Commission, on the other hand should order all eliminations. The present situation is confusing. There is bound to be duplication of work, and the responsibility is scattered and lost.

The reorganization commission is at work redrafting present statutes to conform with the reorganized scheme of government.

Seattle Decides to Borrow

City Will Take $135,000 from Light Department to Tide Railway Over—Superintendent Henderson Asks for Public Co-operation—Explains Savings by Purchase of 80 New Cars

AN ORDINANCE providing for a loan of $135,000 from the light department to the municipal railway department, at Seattle, Wash., a measure designed to tide the railway over its present financial difficulty, has been passed by the Council and signed by Mayor Bertha K. Landes. The measure becomes effective within 30 days, but it faces the prospect of a test suit in court by a committee of fourteen taxpayers, headed by S. B. Asia, who have at all times protested the invasion of the general fund and who have criticised the Council's policy of borrowing money from one fund for the aid of another. They declare there is no statute authorizing the Council to make these loans.

E. L. Blaine, chairman of the finance committee, declares the city has saved about $30,000 a year by using the idle fund of one uti'ity to assist another utility. He points out that the fact that the city is barred by law from loaning the proceeds of bonds voted by the people does not prohibit it from loaning from one utility to another. He points out that by making use of an idle utility fund it becomes unnecessary to borrow money at 5 or 6 per cent.

In the meantime, Mayor Bertha K. Landes has submitted to the Stone & Webster officials in Seattle a request for a revision of the municipal railway purchase contract that would extend the time on the purchase bonds and thus reduce the annual payments on the contract. The proposal was laid before A. W. Leonard president of the Puget Sound Power & Light Company, and Judge James B. Howe, Western attorney for the Stone & Webster interests. Mr. Leonard advised Mayor Landes that he would recommend an extension of time on the bonds, provided it could be done without affecting the priority of the claim of the bonds.

In this connection, Mayor Landes said that "there has never been as much reason for optimism as there is today" in railway affairs. She declares that this optimism should exist because of the reduction in operating expenses which will be effective on Jan. 1, with an estimated saving of $300,000 a year. With this in view, she deprecated any action on the part of citizens to involve the railway in litigation and urged the co-operation of all taxpayers in furthering the affairs of the lines.

Another possible solution of the railway problem under consideration in the City Council is a plan to ask the taxpaxers, if necessary, to pass a general fund bond issue which would place the railway on its feet. The plan thus far is in only the most tentative state and is meeting some opposition in the Council. Councilman W. T. Campbell suggested the plan, pointing out that the city could issue as much as $1,500,000 in bonds, which would put the railways over the peak, he declares.

The City Council of Seattle has accepted the proffered services of the Westinghouse Electric & Manufacturing Company to have one of its engineers conduct a survey of the municipal railway.

D. W. Henderson, general superintendent of the railway, recently issued a statement in which he said:

> There has been so much misrepresentation and distortion of the facts concerning our street railway system and in particular concerning the purchase of the new cars, that I believe the public is entitled to an unbiased statement of the facts.

Trying to Pay Debt in 20 Years

> We are attempting to pay the entire cost of our system out of its income in twenty years, something which no privately-owned road has ever been able to do. In addition we are paying 5 per cent interest on the amount outstanding, and are charged with 4.2 per cent depreciation. In the last six years we have spent $1,736,744 for converting two-man cars into one-man cars and for new trackwork, both of which items are really capital investments. The sum total of these charges amounts to 16.2 per cent on the original investment, which no privately owned line could or would be permitted to earn.
>
> No accurate or impartial statement has been presented to the public concerning the savings to be effected by the purchase of the new cars. Everyone, from the Mayor down, who has taken the trouble to consider the facts and figures, has become thoroughly convinced of the reality of the savings that can be realized by the purchase of the new equipment. If the people of the city will analyze these figures with the same impartiality that they employ in their own affairs, I am certain that they also will be convinced.
>
> It is significant that modernization of equipment has, in absolutely every case throughout the United States, been the solution of the railway problem, and has invariably resulted in putting street railway properties on a paying basis.
>
> Statistics have been gathered by the American Electric Railway Association, comparing twenty representative roads throughout the country which have modernized their equipment with twenty very similar roads which have not done so. The roads involved range all the way from those of large cities like Boston and Pittsburgh down through those of cities of the same class as Seattle, such as Providence and Houston, to the smaller lines in cities of only a few thousand population. They include strictly metropolitan systems, suburban and interurban systems and combinations of the two. The figures, therefore, represent a fair cross-section of the American street railway industry as a whole.

Quotes "Journal" As His Authority

> The detailed statistics can be found in the Sept. 25, 1926, issue of the ELECTRIC RAILWAY JOURNAL, page 495, which is the technical trade paper of the American electric railway industry. The comparison shows an average saving of 9.65 cents a car-mile. The 80 new cars will be run an average of 130 miles a day for an average of 350 days a year, or a total of 3,640,000 car-miles. If we apply this figure of 9.65 cents a car-mile the gross saving to be expected is $351,260.
>
> I have made a detailed analysis of actual Seattle operating conditions. This shows that due to the very heavy and old equipment which we are now using, and the satisfactory rate of wages paid to our men, a much larger saving is to be foreseen. The yearly totals are as follows:

Mechanical department	$114,840
Track maintenance	28,815
One-man operation	261,632
Total	$405,287

> The interest charge on the new equipment will be 6 per cent and the depreciation rate fixed by the state 4.2 per cent. The total purchase price of the new cars is $1,420,000, so that deducting 10.2 per cent of this sum, or $144,840, from the gross saving, there remains a net saving of $260,447.

Digitized by Google

It has been stated that the rerouting plan will eliminate 60 cars and that consequently there will be no use for the 80 new cars. The rerouting plan probably will not save this number of cars, but even assuming that it will, it is nevertheless true that we now are operating 170 old type two-man cars, and it would be economy to place all these old cars in reserve for rush-hour operation and purchase this number of new light-weight cars.

STORAGE AND TRACKAGE AMPLE

No outlay whatever for additional storage tracks or shelter will be required, as the existing carhouses and storage tracks are sufficient to take care of eighty additional cars.

What our street car system needs more than any other one thing is the loyal cooperation and good will of the business men and citizens of the city. Our street car system is vitally important to the welfare of the city and deserves the support of all of our public-spirited citizens. It is certain that obstructionists and pessimists cannot help us. They can only hamper the efforts of those who are trying to do something for the transportation system of the city.

Indiana Commission Under Fire

Foes of the Indiana Public Service Commission are preparing for the coming session of the Legislature, which convenes in January. A bill already is being drafted which will abolish the commission, if it is passed. Samuel Lewis Shank, twice Mayor of Indianapolis and probably the most popular politician in the city, has come out flatfootedly against the commission. He is making addresses at every opportunity urging the people to compel their legislators to pass a bill such as has been suggested.

Fairmont Company Explains How Employee Loans Are Floated

The rules under which the Monongahela West Penn Public Service Company, Fairmont, W. Va., is prepared to make loans to its employees were explained in a recent issue of *Courtesy and Service*, the official publication of the company. Owing to the fact that a mistaken idea was circulated that the company loaned money for various purposes, and because many employees have asked for details, the company, through a resolution of the board of directors, has made it plain that loans can be made only in case of sickness or death in the family of an employee or in other extreme emergencies. The plan of the company is to authorize loans with an aggregate limit of $5,000, with the understanding that no loans shall be in excess of 20 per cent of the yearly salary of the employee.

Loans are to be repaid in monthly installments within a period of one year, with interest of 6 per cent per annum on the unpaid balance. An employee must make written application to the head of his department, supplying proof that the funds are needed for purposes allowable by the company. When the head of the department is satisfied that the request is bona fide he forwards it to the department of public relations, and it goes thence to the treasury department. In case of request for a loan for an emergency other than sickness or death a written request goes first to the head of the department and thence to a committee of three officials, who make recommendations to the president of the company, who passes on it finally.

Kiwanians Reminded of the Value of their Railway

Certain promoters of the public welfare in Scranton, Pa., believe that if trolleys instead of automobiles were used by business men the parking problem in the city would be greatly alleviated. One of these is Otto Conrad of the Conrad Motor Car Company. He has presented to the Kiwanis Club of Scranton 150 trolley tokens and has suggested that business men in Kiwanis start the movement for using the trolleys. He further suggested that Kiwanians might view their city some evening by taking a trolley ride. To the latter suggestion Jilson J. Coleman, vice-president and general manager of the Scranton Railway, replied that he would be glad to provide a special car for the purpose.

In his letter to the president of the Kiwanis Club Mr. Conrad takes occasion to praise the work of Mr. Coleman, who recently purchased new cars "just in order that more people could ride."

Beaumont Motormen Win Accident Pennant

Keen interest was aroused in a contest held by the motormen of the Northern Texas Traction Company, Fort Worth, and other properties recently in an effort to cut down the number of accidents. The city was divided up into eight sections, each section representing a team in the "Texas" League. The plan, then, was to see which team could have the highest percentage for a given length of time. A pennant was the prize.

The team representing "Beaumont" completed the season without any black marks against it. This aggregation, representing about 25 motormen, has been officially crowned champion. "Fort Worth" was a close second. In many cases the mere bumping of an auto fender would cost a "game," so extreme care was taken in all operations.

No Wonder It Ran!

Ever since prohibition the Cincinnati, Lawrenceburg & Aurora traction line has been a daily violator of the prohibition laws—and it didn't know it until yesterday.

A bottle of liquor, good, old-fashioned liquor that makes the mouth water, tumbled out of a compartment under a window of a car that workmen were remodeling. The bottle could have been put there only when the car was built—and it had been in service on that line for 26 years.

For 26 years, then, it was said, the liquor had been reposing in the window compartment, securely sealed from discovery. There's no telling how many passengers had it within elbow reach, so to speak.

Robert Lyons, North Bend, a traction conductor, who traveled around the world with the navy years ago, and who modestly admits he's had experience with the taste of liquor in various parts of the world, sampled the contents just before starting home.

"Boy, it's there," he said. That's all there was. There wasn't any more.—*Cincinnati Enquirer.*

"L" Improvement Work in Chicago Progressing

Work on the platform extensions on the Douglas Park, Logan Square and Humboldt divisions of the west side lines of the Chicago Rapid Transit Company is about 80 per cent completed. Eight-car trains are now being operated in the rush hours on all the other lines and longer trains will be run on the three branches named as soon as the platforms are ready to accommodate them.

Work is now proceeding on the moving of columns on Wabash Avenue at cross street intersections. Thirteen of these supporting columns have to be moved to the edge of the curb, in accordance with an agreement with the city. Four foundations at Jackson, four at Monroe, and three at Washington Street are already completed. Two at Van Buren and Wabash are nearly complete. It is expected that the steel work will be in place around Jan. 1. The cost of this work on Wabash Avenue will be about $125,000. It was necessary to sink the foundations to hard pan, 63 ft. below the sidewalk level.

Casualties Fewer in Westchester

Westchester County, N. Y., reports fifteen dead and 155 injured in automobile accidents during October, 1926, as against sixteen and 180 for a similar month the year previous. Barron Collier, chairman of the Public Safety Bureau, believes the decrease reflects the results of the safety campaign being waged there. He scores, however, the record of one person killed every two days and five seriously injured each day, and suggests that people drive as they would before the accusatory appearance of a policeman so that many lives might be spared and much suffering and misery avoided.

Reference to "Aunty J. Walker" and the safety campaign in Westchester was made in the ELECTRIC RAILWAY JOURNAL, issue of Nov. 27, page 983.

John A. Beeler to Appraise Louisville Property

The appointment of the Beeler Organization, New York City, as appraisers of the properties of the Louisville Railway, Louisville, Ky., was announced recently by Mayor Arthur A. Will. The appointment is subject to the approval of the General Council.

The appointment was mandatory under the new ordinance passed last August for the Louisville Railway. That measure specifies that the property in use and useful for public service will be the basis for the rate of fare. Under the contract with the organization, work will commence within thirty days and will be completed within six months. The railway will pay the costs of the appraisal.

Five-Cent Fare Zones in Tacoma

According to an agreement between the City Council and the Tacoma Railway & Power Company, Tacoma, Wash., the railway lines on Dec. 20 were to begin operation on the zone basis, with a central 5-cent fare zone. Tokens will remain at the same price as now and will be good for a ride either in the outside zone or through both zones, with universal transfer privileges. For token riders the new system will mean no change except that the pay-as-you-leave system of fare collection will apply to all lines on outbound trips, whereas it was in effect only on the Sixth Avenue and Point Defiance lines.

The idea back of the zone system is to increase the amount of short, downtown and close-in district riding by establishing a cheap fare. Cash fares in the outside zone or for riding through both zones, with universal transfer privileges, will be 10 cents under the new plan; this is an increase of 2 cents. The increase will affect only 10 per cent of the riders living in the outside zone, it is reported by the Tacoma company. Mayor M. G. Tennent pointed out the publicity value of the system, in that any stranger riding from a depot to uptown points would pay only 5 cents, and thereafter think of Tacoma as a 5-cent fare city. The 5-cent fare will carry no transfer privilege and the zone system will cover a period of 60 days.

The six months trial period under which the company has been operating expires Jan. 1, but under the new agreement will be extended to cover the zone test. Under the test agreement the company had the right to demand higher fares for the past three months, but has withheld such demand in the interests of a friendly settlement. Manager Richard T. Sullivan of the company estimates that a gain of $68,184 might be expected under the zone system, but it is pointed out that this falls far short of the yearly deficit of $195,000 which the company claims it would suffer during 1917 if the present fares were maintained.

Wages Advanced in Baltimore

The United Railways & Electric Company, Baltimore, Md., has granted an increase in pay of 1 cent an hour to all motormen, conductors, shop employees and the members of the force of the engineering department and to train dispatchers. The change will become effective on Jan. 1. In addition to this 1-cent increase, the company also has agreed to another increase of 1 cent during 1928.

The agreement was in the nature of a compromise. The United Railways Association asked for an increase of 3 cents an hour, to take effect on Jan. 1. Representatives of the association and of the company were in conference for several hours before the plan of increase agreed upon was worked out. Members of the association were shown by the United officials that an increase of 3 cents could not be granted without an increase in fare.

President Emmons said that it was the company's aim to continue the present 7½-cent fare, but with operating costs increasing constantly on account of traffic congestion it became more and more difficult to do this and give good service.

Following the agreement, Mr. Smith, the president of the association of employees, and George Wolf, chairman of the wage committee, issued a statement as follows:

> The men of the United Railways whom we represent want an increase in wages of 3 cents an hour, but we realize that in the company's present earning condition no such increase in wages is possible unless there is an increase in fares.
>
> We do not desire to subject Baltimore car riders to an increase in fares at this time, since we feel that Baltimore's favorable position as a city of low living cost and hence as a desirable city for the growth of industry and business is largely due to its reasonable rate of fare.

The change will make the minimum wage 49 cents and the maximum wage 54 cents in 1928, with 59 cents for one-man car operators.

The increase will add about $150,000 to the payroll during 1927 and double that amount in 1928.

Buffalo Employees Get Pay Boost

Thomas E. Mitten, president of Mitten Management, announced at a recent meeting of the International Railway Co-operative Association that the basic wage rate of employees of the International Railway, Buffalo, N. Y., would be increased for the year 1927 by 2½ cents an hour. This increase is in recognition of the splendid co-operation of the employees through whose efforts accidents have been reduced 15 per cent in the last two years.

St. Louis Franchise Negotiations to Be Resumed

Resumption of the negotiations between officials of the St. Louis Public Service Company, St. Louis, Mo., and the city authorities relative to a new blanket franchise for the United Railways probably will be resumed during January. In the meantime it is expected the Missouri Public Service Commission will pass on the application of Receiver Rolla Wells for an increase in fares. The Public Service Company seeks to be permitted to earn 7 per cent under a service-at-cost franchise. In the face of the recent United States Supreme Court decision Mayor Miller has not retreated from his position favoring a 6 per cent return. He says he will explain his views to the public.

Survey in San Francisco Started

San Francisco, Cal., city officials have started a survey with the end in view of acquiring the Market Street Railway and consolidating it with the Municipal Railway system. The Board of Supervisors' resolution calling for the survey was referred to in the ELECTRIC RAILWAY JOURNAL, issue of Dec. 18, page 1108. Mayor James Rolph, Jr., and City Engineer M. M. O'Shaughnessey were excluded from membership on the joint committee. The first of the Market Street Railway franchises, mentioned in the resolution, will expire in 1929.

Committee Reports on Rochester's Subway Railroad

That the city-owned subway in the bed of the abandoned Erie Canal at Rochester, N. Y., be operated by the New York State Railways under a service-at-cost contract was the recommendation made by the Mayor's committee on subway operation in its report to Mayor Martin B. O'Neil. The report is the result of a two years study by the committee which was named by the late Mayor Clarence D. Van Zandt, Mayor O'Neil's predecessor.

The report suggests a three-year trial under a contract similar to the one by which the railway operates its bus and trolley system in the city, to be under the supervision of Charles R. Barnes, railway commissioner.

Under the plan submitted, the five steam railroads using the city railroad would have individual leases for interchanging freight cars over the line, but the motive power for the operation would be supplied by the New York State Railways. No terms other than that the passenger fare over the new railroad be 8 cents, the same as on the city lines, were suggested.

Under the proposed plan, if at any time returns from operation exceed $100,000, the surplus is to be divided equally between the city and the general fare determining fund set up by the service-at-cost contract. At no time is the city to lose title to the property and at the end of three years a new plan can be tried out if the one suggested is not successful.

The line is nearly completed and it is expected that it will be in operation in the spring. The subway bisects the heart of the city and is designed to relieve traffic congestion by taking over interurban lines now on the surface and also to help industry by providing manufacturing plants with better switching facilities, in co-operation with the steam railroads. The subway is more than 8 miles long and for a mile in the downtown section is covered by an overhead street.

In making the report the committee stated that public service demanded the operation of the line be placed in experienced hands and that diversion of interurban or city trolleys would complicate any plan for operation by a city-owned or independent company. It was pointed out that the New York State Railways had the equipment, the experience and other essentials for carrying out the transportation program. It is generally believed that the New York State Railways will operate the railroad.

The Rochester Bureau of Municipal Research supported the report after an exhaustive study of municipal railroads in the United States. Stephen B. Story, director of the bureau, stated that the bureau's survey disclosed no project like the one attempted in Rochester. Mr. Story recommended an amendment to the service-at-cost contract to protect further the city's interests and asked that the contract be amended before a single car were actually put in operation.

The railway lines in Rochester have been operated for the past five years under the service-at-cost contract.

Dissension Over Fare Increase

Amsterdam Demands Return to Five-Cent Rate Following New Schedule Approved by Commission

The Common Council of Amsterdam, N. Y., made formal demand of the Fonda, Johnstown & Gloversville Railroad for a return to the 5-cent fare on the West Main Street branch, effective on Jan. 15. The demand is based on terms contained in a franchise granted several years ago for the establishment of the West Main Street division, which stipulates a 5-cent fare "from and to any part of the branch within the corporate limits of the city." A few years ago the Common Council waived this fare clause so that the company might increase the rate to a uniform 8-cent city fare. This uniform city fare was recently declared obsolete by Public Service Commissioner Van Voorhees when company officials appeared before him at Albany and asked for a 10-cent fare. Their request was granted. Amsterdam was the only city affected by the ruling which opposed the increase. In the resolution a provision was included that notice of the Council's action be forwarded to the Public Service Commission.

The Public Service Commission approved a new schedule of passenger fares on Nov. 12 to be charged by the Fonda, Johnstown & Gloversville Railroad on the electrically operated portions of the system. The commission found that the present maximum fares were insufficient to yield a reasonable compensation for the service rendered and that they do not yield a reasonable average return on the property used in public service.

In the commission's order, the fares fixed are as follows:

One-way interurban rate between Gloversville and Fonda and intermediate points and between Gloversville and Schenectady and intermediate points, now fixed at approximately 3 cents a mile, with a minimum fare of 6 cents, may be increased, but not to exceed 3½ cents per mile with a minimum fare of 8 cents. Round-trip tickets may be increased in the same proportion.

Fifty-four-trip commutation rates and 46-trip school rates on the interurban lines from Gloversville to Schenectady, inclusive, between Amsterdam and Hagaman and between stations on the Fonda Division from Gloversville to Fonda, inclusive, may be increased, but not to exceed 25 per cent in advance of the rates now being charged.

Twenty-four-trip commutation rates between Gloversville and Fonda and between Johnstown and Fonda may be increased, but not to exceed 25 per cent.

In all cases where local fares of 8 cents are now being charged the rate shall not exceed 10 cents. This rate is effective in the cities of Amsterdam, Johnstown and Gloversville. In all cases where 12-cent fares are being charged the rate shall not exceed 15 cents.

For school ticket books it shall not exceed a rate of $5.30.

In place of four-strip tickets, for which a charge of 30 cents is now made, and twenty-trip coupon books, for which a charge of $1.50 is now made, good in all cities and villages where the local 8-cent fare now applies, three-ride strips may be issued at a rate not to exceed 25 cents. Between Gloversville and Johnstown and between Amsterdam and Hagaman, where the regular single trip fare is now 12 cents, eight-trip tickets may be issued not to exceed $1.

In the decision of the commission it was shown that $66,982 was available for return on the property investment for the year 1925; this constituted a return of less than 2 per cent upon its cost. This amount is the surplus after deducting from operating revenues the operating expenses, including taxes, and without including in operating expenses the additional yearly charge of 3 per cent for depreciation allowed in a former case involving the rate of the company.

The commission also rescinded its order under date of Sept. 1, 1926, approving a declaration of abandonment of its Vrooman Street line in the city of Amsterdam. This order was based under existing rates of fare. The commission stated it is now of the opinion that the Vrooman Street line should be operated for a reasonable period of time under the new fare rate.

Street Traffic Survey of Chicago Completed

Report Based on Year's Study of Traffic Conditions in Streets—Revised Traffic Regulations Recommended

BASED on studies of traffic conditions in Chicago, made during the course of the last twelve months, the Metropolitan Street Traffic Survey presents a complete and highly informatory symposium on this most baffling of problems. At best, according to the report, the difficulties, bad as they are at present, are only beginning. With the growth of the city and the increased saturation of automobiles the number of vehicles in Chicago will probably increase from 350,000 at present to nearly 900,000 by 1950. Most of this is due to a growth in population, but partly to the increased saturation, which at present is 8.9 persons per car, and is estimated will be five persons per car in 1950.

Performance of street cars, as gleaned from the report, is one of the strongest testimonials for this type of mass transportation that can be found. Nearly a million rides into and out of the central business district are made every day between the hours of 7 a.m. and 7 p.m. on vehicles using the surface of the streets. Nearly 60 per cent of this traffic is in surface cars, which contribute only 8.4 per cent of the vehicles entering or leaving this district. Private automobiles, on the other hand, provide transportation for 33 per cent of the riders, but by using nearly 90 per cent of the vehicles. Accidents are also an important factor, but the street cars and elevated together cause only 5.4 per cent of the accidents in the city at large, while the automobiles cause 94 per cent.

Buses are of almost negligible value. As shown by the report, they provide transportation for only 9 per cent of the daily riders in and out of downtown Chicago. They constitute 1.8 per cent of the vehicles and produce only 0.7 per cent of the accidents.

Interterminal movement of l.c.l. freight is considered one of the most important factors in street congestion.

During March, 1926, 69,508,959 lb. of freight were moved in 13,806 loads over the streets of Chicago in purely interterminal transfer. In addition to this 16,283,879 lb. of freight in 1,803 loads moved between the docks of two boat lines and the freight terminals that are dotted around the edges of the central business districts. Many of these loads pass over the congested streets of the Loop.

The report and recommendations are contained in a printed volume of 292 pages, replete with tables, diagrams and views taken to illustrate the traffic situations discussed. The report proper is presented in thirteen chapters in Part I and the recommendations in two chapters of Part II. Among the latter it is recommended that a street traffic commission be formed and a traffic engineering division, attached to the Bureau of Streets, functioning under the Department of Public Works. A reorganization of the traffic division of the Police Department is given in detail. Firmer and more systematic enforcement of traffic laws is considered essential, and many suggestions are made for traffic signs and signals to guide the motorists in the right use of the city streets.

The report is directed to the Mayor and City Council of Chicago and was made by the Chicago Association of Commerce at the invitation of the Council given in November, 1925. The report was signed by William R. Dawes, president of the association, and Elmer T. Stevens, chairman of the street traffic committee of the Commerce Association. Doctor Miller McClintock, director of the Albert Russell Erskine Bureau for Street Traffic Research at Harvard University, was engaged to direct the studies and prepare the report.

New Office Quarters of Brooklyn Railroads

The Brooklyn-Manhattan Transit Company, Brooklyn, N. Y., has leased six floors of the new Wittemann Building, or a total of 60,000 ft. of space, for a long term of years at an aggregate rental of approximately $2,500,000. The Brooklyn City Railroad has leased an entire floor containing 10,000 ft., at an aggregate rental of about $400,000 for the 20-year period.

The new building is a 35-story structure now in course of construction at De Kalb and Flatbush Avenues on the Flatbush Avenue extension. The present structures occupied by the railways as their office headquarters were owned by the Brooklyn City Railroad, but were recently sold by it. They are in the so-called financial district of Brooklyn, in which there has been a phenomenal rise in realty values in recent years. The building soon to be occupied by the railways for office purposes is equally as accessible from Manhattan as was the old one, and is in a new center of activity close to the business section of the borough.

The B.-M. T. will occupy the eleventh to sixteenth floors inclusive of the new building and the Brooklyn City the tenth floor. Occupancy by them will date from April 1, 1928.

Electrification Report on Reading Expected Soon

Engineers who have been working out plans for the electrification of some of the lines of the Reading Company at Philadelphia are expected to have their report completed early next year. Before the survey is submitted, officials at the Reading Terminal anticipate, the preliminary plans for replacing steam with electricity will be completed covering the electrification of approximately 40 miles of line on the Chestnut Hill, Bethlehem and New York branches of the Reading system.

About a year ago the directors authorized the management to engage engineers to make a complete survey of the electrification project, but thus far no funds have been appropriated to carry out the operation.

The new service will be installed on the New York branch to Trevose, Pa., a distance of 20 miles from the Reading Terminal at Twelfth and Market Streets, Philadelphia. The company now operates 35 suburban trains daily to and from Trevose and 21 on Sundays.

From Jenkintown to Lansdale will add about 13½ miles more to be electrified on the Bethlehem branch.

The electrification of the Chestnut Hill branch will embrace about 5½ miles additional.

That section of the Reading system between the terminal at Twelfth and Market Streets and Jenkintown is included in the 20 miles of electrified line extending on the New York branch to Trevose. This includes the line from Wayne Junction to Jenkintown.

It is said that power will be purchased from the Philadelphia Electric Company.

Where the Token Goes in St. Louis

The United Railways, St. Louis, Mo., has placed a large electrically illuminated and operated signboard on its property at Grand Boulevard and Park Avenue, to show the car riders passing that point "Where Your Token Goes." The board shows a young lady who deposits her token in payment of fare into the fare box of a car. As the token falls into the box a number of electric lines shoot from the token to various items listed on one side of the board, showing how the token is divided. It reveals, among other things, that 3.5 cents, or exactly half of the token, goes for wages, and another 1.5 cents for supplies.

Rochester Interurban Safety Contest On

An accident prevention contest will start between the trainmen on the Rochester & Eastern division and those on the Rochester & Sodus Bay division of the New York State Railways on Jan. 1. Each month the division operating the most car-miles an accident will be declared the winner and the head of that division will be awarded a banner reading "Safety Division." The number of points charged for various kinds of accidents, and other rules, will be the same as in the contest of the city lines.

An interurban motorman on the Rochester lines operating an entire year (2,700 hours) without an accident point charged against him will receive a $2,000 insurance policy paying $20 a week for sickness and accident disability. Interurban conductors will receive $1,000 in insurance and $10 a week for sickness and accident disability, the same as city conductors. The state appoints a committee for three months, consisting of one motorman and one conductor from each interurban line, who will meet each month in the office of the superintendent of the interurban division to make safety suggestions and review accidents of the previous month.

2,000-Mile Air Service Suggested by P. R. T.

An offer to operate a 2,000-mile air service, passenger and freight, between New York and Atlanta, and Chicago and New Orleans, with the government co-operating, was made on Dec. 7 to Secretary Hoover and Postmaster-General New by Mitten Management, Inc., operator of the Philadelphia Rapid Transit system, Philadelphia, Pa. Both federal department heads have commended the air line which the company established and maintained between this city and Washington for passengers and mail during the Sesqui-Centennial Exposition period, and the transit company has made it plain that it would undertake a more comprehensive service next spring if government support be assured.

In its five months operation the Philadelphia Rapid Transit air service carried 3,595 passengers. In his offer Mr. Mitten stated that the company was satisfied that transportation of passengers and merchandise was not only necessary to the success of commercial aviation, but that the revenue derived from such operation would equal approximately 50 per cent of total costs. The remaining 50 per cent the company hoped to secure through air mail by commitment of cities through which the company operated to use air mail to the extent necessary to assure quantity required.

Free Rides in Seattle Prove Success

The Seattle Municipal Railway, Seattle, Wash., which on two days, Nov. 26 and 27, carried shoppers downtown free for one-hour to start the Christmas shopping season, did a business unprecedented in its history. On Friday, from 9:30 to 10:30, the free hour, R. E. Furse reports the line carried 25,000 people. Fifty additional cars were operated and the passengers were carried expeditiously and without mishap. The railway, it is estimated, gained about $4,000 in revenue during the two days from fares paid by the shoppers on their homeward bound trip. D. W. Henderson, superintendent, believes these shoppers will make frequent use of the cars during the holiday buying season. Downtown stores report the largest volume of business during any two days in November history.

More Men to Share in Los Angeles Awards

The merit and bonus system of the Los Angeles Railway, Los Angeles, Cal., is to be continued for 1927 under a new plan by which a larger number of men will participate in special awards. The main provisions follow:

The management sets aside $5 a month for each man engaged in passenger car service six months or more and who performs satisfactory service, this bonus to be paid on Dec. 15 to those remaining in active service on Nov. 30, 1927.

Work in passenger service shall be construed as meaning the operation of passenger cars as motormen, conductors or safety operators.

No bonus will be paid men on sick leave, leave of absence, or working in other departments. Deduction from bonus will be made for all lost time in each calendar month in excess of five full or ten half days.

For the fiscal year 1927 special awards of two classes will be allowed.

First Class.—To all men in active passenger service who have not lost more than 60 days time, holidays excepted, and who have a clear courtesy and accident record, and who have received no demerits, will be awarded $40 in cash.

Second Class.—To all men in active passenger service who have not lost more than 60 days time, holidays excepted, and who have a clear courtesy and accident record, and who have not been demerited more than three times, there being no repetitions under any one classification, and who have received no demerits for infractions of rules under classifications printed in caps on list of causes for demerits, will be awarded $20 in cash.

Where it is found necessary to assess demerits against a man who has been previously demerited for the same offense during the past or present bonus year, the penalty will be from 25 demerits to removal from the service. Demerits will be assessed on recommendation of division superintendents, supervisors, instructors, safety men and others in authority. Deduction from bonus will be made at the rate of 25 cents for each five demerits assessed (five demerits equal 1 per cent) regardless of the efficiency rating shown on record.

When a man's efficiency rating drops to 75 per cent or below, he is subject to automatic dismissal from service. However, dismissal from service for certain offenses may be made regardless of efficiency rating.

Ten credits will be allowed each month for clear courtesy record, and ten credits for clear accident record.

No credits or demerits will be given during the first 90 days in service, and no bonus will be allowed for the first six months in service.

Demerits will be canceled only in case of an error in the report or extenuating circumstances, which must be explained to the satisfaction of the supervisor of merit system.

Appeals from dismissal must be made within three days. Appeals from demerits assessed must be made within 30 days.

One-Man Cars Win in Atlanta

The use of one-man cars in Atlanta, Ga., by the Georgia Railway & Power Company was upheld by the State Public Service Commission at a hearing conducted on Dec. 15. A petition asking that the company be restrained from operating one-man cars on two city lines—the South Pryor Street line and the River line, running between the city hall and the Chattahoochee River, —was presented to the Public Service Commission by R. O. Rivers and others representing residents in the sections served by the two lines. There are now more than 60 one-man cars in operation by the Georgia Railway & Power Company in Atlanta.

Utah Company Given Hearing

The case of the Salt Lake & Utah Railroad, Salt Lake City, Utah, which is seeking to retain its right to participate in westbound transcontinental rates and to secure the right to participate in eastbound transcontinental rates, was heard on Dec. 11 before the Interstate Commerce Commission. H. I. Moore, receiver for the company, made the principal argument for the carrier. A few years ago the commission permitted the Salt Lake & Utah to participate in westbound transcontinental rates, but a year later the order was reversed and the right of participation denied on protest of the Union Pacific and other carriers. The Salt Lake & Utah Railroad applied for a rehearing and the argument on Dec. 11 was in support of that application. Mr. Moore filed an extensively signed petition from shippers along the line of his road asking that it be accorded the privilege of participating in transcontinental rates eastbound and westbound and stating that denial of this privilege would work substantial hardship on them. If the last order of the commission should stand, all transit privileges would be denied, as well as the privilege of diverting traffic in transit. If the Salt Lake & Utah were allowed to participate in such privileges its financial condition would be improved, it is said.

Winter Ride-Selling Ideas at Levis

The Levis Tramways, Levis, Canada, whose success in various fare changes was mentioned in an article on "La Passe Hebdomadaire" in the ELECTRIC RAILWAY JOURNAL, issue of Dec. 11, page 1047, has lately added several winter ride-selling ideas under the direction of H. E. Weyman, general manager.

One innovation is an open-air skating rink at the old carhouse property on a hill. This is the first full-size rink ever constructed on the South Shore (opposite Quebec). It is well illuminated and has suitable accommodation for ladies and gentlemen. A popular added feature is a hockey team, which draws good crowds on Sunday afternoons and has induced the formation of other teams on the South Shore. Another feature for stimulating rides in winter has been the erection of a toboggan slide by the local snowshoe club at a location of some advantage to the trolley.

Revenue for the pre-winter period July-November, 1926, shows an advance of 5 per cent over a similar portion of 1925, the increases coming in cash and weekly pass revenues. In this connection it may be well to call attention to the fact that the graph in the Dec. 11 article entitled "weekly passenger revenue only" should have ready "weekly pass revenue only."

Inquiry Into P.R.T. Service

An investigation of transit facilities in Philadelphia, Pa., is to begin shortly. This statement emanated from the Public Service Commission, which met in executive session in Harrisburg on Dec. 20. The state body will review car riders' complaints against alleged curtailment of service by the Philadelphia Rapid Transit Company and protests against that company's operating policies, which were brought to the attention of the Governor recently and upon which he ordered an inquiry.

Holyoke Makes New Contract for Power

The Holyoke Street Railway, Holyoke, Mass., has contracted to take power for the operation of its railway system from the Holyoke Water Power Company. The change went into effect on Dec. 5 and the power was generated at the No. 2 plant, which furnishes 2,000 hp. It is estimated the Holyoke Water Power Company will supply 500,000 kw.-hr. per month.

News Notes

Headquarters Changed.—The Connecticut Company has decided to remove its headquarters at Manchester, Conn., and combine it with operations at Hartford. Formerly runs to Rockville, Stafford Springs and other points had their headquarters at Manchester. These and also the Hartford-Manchester run will operate out of Hartford. This means that all rolling stock will be housed at Hartford and the old carhouse at Manchester will be sold.

Wages Increased.—Four hundred and fifty trainmen, employed by the Union Traction Company of Indiana, Anderson, Ind., are receiving pay under an increase in hourly wages recently granted. A flat raise of 2 cents an hour was granted. The new scale for city trainmen is 32 to 39 cents an hour. The new scale for interurban trainmen ranges from 41 to 46 cents an hour, based on the length of service.

Would Operate Over Extensions.—The Fresno Traction Company, Fresno, Cal., has applied to the Railroad Commission for a certificate of public convenience and necessity to operate over McKenzie Avenue and Fresno Avenue extensions of its line. These extensions were constructed under a franchise issued Dec. 21, 1922.

Retires After Fifty-seven Years.—Brayton D. Sweet recently retired as superintendent of the Mount Pleasant division of the United Electric Railways, Providence, R. I., after serving the company for 57 years. Mr. Sweet is 73 years old and has been enrolled on the pension list. When invited recently to drop around to the carhouse a radio set was presented to him.

Trolley Guide in Washington.—With the co-operation of the Washington Railway & Electric Company and the Washington Rapid Transit Company, the Capital Traction Company of Washington, D. C., has printed a new issue of the trolley guide. The guide was designed primarily to assist visitors to the capital in finding their way to points of interest. It contains much valuable information for local residents, particularly those not entirely familiar with all the transportation lines of the city. It contains a map in red showing all the local transportation lines, street railways, the bus lines of the Washington Rapid Transit Company, the feeder bus lines of the two street railways and the route of the Chevy Chase Coach line.

P.R.T. Gets Radio Privilege.—A resolution giving the Philadelphia Rapid Transit Company, Philadelphia, Pa., exclusive use of the Camden municipal broadcasting station for one hour on alternate Mondays for six months beginning Jan. 3 was passed on Dec. 16 by the City Commission of Camden. While it is understood by the commission that the station will be used by the company mainly in sending out entertainment programs, no restriction was made in the broadcasting of other matter.

$8,035 in Accident Bonus.—The Memphis Street Railway, Memphis, Tenn., will distribute among its crews $8,035, being extra pay earned by the men in reducing the cost of accidents for the past three months. The savings effected during November were $2,056. This sum added to the savings effected during September and October makes for the three months the total above.

New Directory in Baltimore.—The United Railways & Electric Company, Baltimore, has just issued a railway directory of the city as a help to all car riders. This has been sent out without charge with an attractive Christmas and New Year card inclosed. The public also has been invited to request copies of the directory. The directory includes a large map showing the route of every line operated by the company. Legends also show the terminals of the lines, Blue Bus lines, auxiliary bus lines, trackless trolley lines and short line routes. The routes of all the lines also are given in the directory. Other information of value to the car rider consists of the routes of all-night cars, a schedule of the first and last cars on weekdays, the routes of the buses and trackless trolleys.

New Arrangements for Supplying Current.—The Kewanee Public Service Company, Kewanee, Ill., may dismantle the old Wethersfield power house, which furnished current for the railway, and rent the property. Ten old cars are to be junked as the company will retain only the newer equipment. Current will be supplied through a hook-up with the interurban power line.

Recent Bus Developments

Would Stop Competitive Bus Operation in Louisville

James P. Barnes, president of the Louisville Railway, Louisville, Ky., and Churchill Humphrey, general counsel, are seeking to block the proposed bus endeavors of the People's Transit Company, which plans to operate buses in Louisville in competition with the railway. Threats of legal action were sent to Robert L. Page, attorney for the People's Transit Company. Mr. Barnes' letter reads as follows:

The Louisville Railway has seen your announcement that you propose to operate buses in competition with street cars on Broadway, Market Street and other streets.

Before seeing you invest your capital in the prosecution of an enterprise of this kind I want to call your attention to the fact that such operation is a violation of the franchise rights of the Louisville Railway.

I also wish to advise you that in order to protect its franchise rights the Louisville Railway is prepared to, and will, invoke the full remedy afforded a property owner by the laws of the land.

A start was promised with the new service on Dec. 15, but institution of the service has been postponed.

Straps in New Jersey Public Service Buses

An order for hand straps for about 375 of its new gas-electric buses has been placed by the Public Service Transportation Company, Newark, N.J. These buses are already equipped with hand rails in front of the longitudinal seats on either side, but it is believed the hand straps attached to the hand rails will be an added convenience to passengers, especially in rush hours.

It is planned to install twelve hand straps in each bus, six on either side. The work of equipping the buses with these straps will be started as soon as the first consignment of the straps arrives.

Bus Substitution Opposed

Whether the United Railways shall be allowed to substitute bus service for railway service in Portland, Ore., on a line from 23d and Washington Streets to Mount Calvary Cemetery is under discussion. The matter was referred to the City Council by W. F. Turner, president of the United Railways and the Portland, Spokane & Seattle Railway. The Council, in turn, has placed the matter in the hands of Commissioner Mann.

The railway line affected starts at the end of the King's Heights line to the cemetery. The Mount Calvary line was built at about the same time as the King's Heights line and was connected with the lines of the Portland Electric Power Company and operated by that company. W. H. Lines, vice-president of the Portland Electric Power Company, stated that the abandonment of the Mount Calvary line would have no immediate effect on either the Kings Heights line or the Arlington Heights line, not owned by the P.E.P. company but operated at a loss.

H. M. Easterly, attorney for property owners who object to the removal of the tracks, stated that the United Railways, essentially a steam carrier, was obligated to continue the service as part of the price it agreed to pay for the use of street ends adjacent to the water-front, and that people had established their homes in the district under the impression that electric railway service was assured.

Transfers Bus Rights. — The Union Traction Company has been granted permission by the California Railroad Commission to transfer to the Auto Transit Company the operative right of the former for a bus service between Santa Cruz and Capitola and Santa Cruz and Twin Lakes and intermediate points. The purchaser is authorized to operate the same under the conditions now maintaining.

Want Bus Line.—People in the Farmington Avenue section of Bristol, Conn., have petitioned the Bristol & Plainville Electric Company to establish a bus line to cover their section of the city. This section is growing rapidly and many residences are under construction at this time and new subdivisions are being planned for spring expansion. The Bristol & Plainville Electric Company has surveyed suburban sections and found that so many house owners owned cars it would be unprofitable to open new lines. However, the section referred to is more densely populated now.

Bus Service to Open Soon.—Seven of the thirteen motor coaches which are to be operated in Nashville, Tenn., by the Tennessee Transportation Company are expected to arrive from Chicago shortly. The five routes they will serve have been approved by the City Council. The coaches, representing an investment of $120,000, are of the street car type and equipped with every modern device. Each seats 29 passengers. The service to be operated is supplemental to and will be co-ordinated with the railway service of the Nashville Railway & Light Company. The coach lines extend principally into the rapidly growing suburban districts which are not afforded transportation facilities at the present time.

Allowed to Discontinue Bus Service.—The Aurora, Elgin & Fox River Electric Company, Aurora, Ill., has been authorized to discontinue its bus service between Aurora and Yorkville, marking the withdrawal of the utilities company from the down-river territory. The commission has granted the Cannon Ball Coach line a permit to cover that route. The interurban line was abandoned in 1924 and tracks and all equipment removed, after the line had been showing a deficit for several years. The bus line, which competed with the Cannon Ball, although the latter was restricted from serving the Aurora-Yorkville territory, but included territory beyond those points, also failed to support itself.

Allowed to Provide Bus Service.—The Willapa Electric Company, Aberdeen, Wash., has been granted permission by the Department of Public Works to provide motor passenger service between Raymond and South Bend.

Bus Permit Granted.—A certificate has been granted by the Railroad Commission to the Los Angeles Railway Corporation, Los Angeles, Cal., to operate coach service for the transportation of passengers between Los Angeles and Culver City.

No Opposition to Bus Petition.—The Public Service Commission on Dec. 13 heard the application of the Eastern New York Transportation Corporation, a subsidiary of the Eastern New York Utilities Company, for a certificate for the operation of a bus line in the city of Hudson and town of Greenport and for permission to issue capital stock and sell the same to the Eastern New York Utilities Company. The purpose of the petition is to secure commission approval for the substitution of bus for railway service in the city of Hudson. No opposition was voiced.

Buys Bus Line.—Edgar L. Shepardson, president of the Templeton-Gardner Street Railway, Templeton, Mass., has announced the purchase of the Gardner to Winchendon bus line from the Flanagan Bus Company. Two modern buses are included in the deal, which it is expected will be approved by Selectmen of Winchendon, Baldwinsville and the City Council of Gardner.

Bus Extension Serves Rapidly Growing Section.—The San Diego Electric Railway, San Diego, Cal., has extended its bus service on the El Cajon Avenue line from Euclid Avenue to 56th Street at Redland Gardens. Although the railway felt that the bus line at this time would not entirely pay its total expenses, it believed that that section of the city was rapidly growing and that continual growth would bring about in time a profitable return. The through service to Redland Gardens is operated on a 40-minute headway. The extension from Euclid Avenue to Redland Gardens is covered by an additional 5-cent fare zone. However, the $1 school pass is honored to the end of the line for students in that vicinity.

Will Fight for Bus Service.—The Key System Transit Company, Oakland, Cal., desires to substitute bus service for railway service on San Pablo Avenue between MacDonald Avenue and Alvarado Park, in Richmond, Cal. The City Council received a letter recently from George H. Harris, general manager of the company, asking the Council to reconsider its resolution of Nov. 9, when the railway was urged to double track the Alvarado Park line and make a complete loop connecting with the 23d Street line at San Pablo. Mr. Harris declared that a railway was dangerous to passengers boarding and leaving cars; that the large capital outlay in new rails and street paving was not justified; that the car line was operated at a loss, and, further, that bus service would be adequate for the district.

Financial and Corporate

Ogden Property Passes to New Hands

Control of the Utah-Idaho Central Railroad, Ogden, Utah, passed to new owners on Dec. 14. The line was purchased on Nov. 5 at a receivers' sale by a committee of bondholders for $1,500,100. Acting under an order made by Judge Johnson of the United States District Court, P. H. Mulcahey, receiver and former general manager of the company, made the sale.

The present Utah-Idaho Railroad is an outgrowth of the joining of the street railway systems of Ogden and Logan. The consolidation was made in 1914 when the company was building the present line, which extends from Ogden to Preston, Idaho. When the company was formed it was known as the Ogden, Logan & Idaho Railroad. Early in 1919 the name was changed to the Utah-Idaho Central Railroad. Reference to the boldholders' taking over the Utah property was made in the ELECTRIC RAILWAY JOURNAL, issue of Nov. 20, 1926, page 948.

Commenting on the purchase the Salt Lake *Tribune* says that it is understood Mr. Singleton represents Kuhn, Loeb & Company of New York, the same concern which is behind the Missouri Pacific. The Missouri Pacific is half owner of the Denver & Rio Grande Western, which gives it a close connection with Salt Lake and an outlet over the Western Pacific to California. With the purchase of the Utah-Idaho Central and the expected extension of that line, it would provide, the *Tribune* says, not only a competing line into Idaho, but perhaps the northwest as well.

Small Illinois Properties Would Abandon Service

The Murphysboro & Southern Illinois Railway, which operates between Murphysboro and Carbondale, Ill., a distance of 8 miles, applied recently to the Illinois Commerce Commission for permission to discontinue service and did so on Dec. 13 on its line between Murphysboro and Carbondale.

The Murphysboro Electric Railway, Light, Heat & Power Company, operating in Murphysboro for 2 miles, has also asked for permission to quit the railway business, pointing out that it has not operated passenger cars since March 18, 1925, and that its freight business does not meet expenses.

Chicago City Protective Committee Appointed

M. A. Traylor, president of the First National Bank of Chicago, and John W. Esmond, vice-president of E. H. Rollins & Sons, have been elected members of the committee representing holders of Chicago City Railway first mortgage 5s and Calumet & South Chicago Railway first mortgage 5s. Mr. Traylor also was elected acting chairman. Mr. Traylor is known nationally as a banker and corporation executive. He was recently elected a director of the General Electric Company.

Control of New York City Line Passes

Representatives of Fifth Avenue Coach Company Are Elected to Board of Surface Line

Improvement of the equipment of the New York Railways, New York City, operating about 70 miles of underground conduit railway, mostly in the Borough of Manhattan, is promised by John D. Hertz, chairman of its board of directors, in announcement of the policy of the new board elected as the result of the acquisition of control of the company by the Fifth Avenue Coach Company.

Mr. Hertz said:

> It is our idea to make electric surface transportation in New York the best possible. This will involve an immense expenditure of money, even though the company is not earning a fair return on its present investment.
>
> But, firm in the faith that we shall have the full co-operation of the public, we are about to begin an extensive program of improvements.
>
> One of the first things to be done will be to array our equipment, so to speak, in a new suit of clothes and to keep the cars at all times fresh and clean.
>
> We have the full co-operation of our employees, and a committee appointed for this purpose by the New York Railways Brotherhood has made suggestions to improve traffic conditions, which will be brought to the attention of the authorities.
>
> Should motor coaches be required as the facility best adapted to the ends in view, the company stands ready to introduce them. In this the company has the advantage of connection with the Fifth Avenue Coach Company, the mother company of all city motor coach operation.
>
> In a word, we aim to give the kind of transportation which will serve the public best and give the city of New York a pride in its existence. This is modern transportation.

Mr. Hertz announced the full board of directors of the New York Railways, the election of himself and seven other Chicago men having been made known previously. The Chicago members of the board are, in addition to Mr. Hertz: Edward N. D'Ancona, Albert Ettlinger, Leonard S. Florsheim, Albert D. Lasker, Charles A. McCulloch, Stuyvesant Peabody and John A. Ritchie.

Other new members of the board are John C. Jay, Robert Lehman, Grayson M-P Murphy, Charles H. Sabin, Elmer Schlisenger, David A. Schulte, Frederick Strauss, Edmond E. Wose and Frederic T. Wood.

Members of the old board who were re-elected are Harry Bronner, J. P. Cotton, George B. Gibbons, Samuel L. Martin, H. J. Sheeran and Willis D. Wood. Five members of the old board resigned, Haley Fiske, Henry V. Poor, Boykin Wright, J. J. Heffernan and W. G. Strait.

The New York Railways, with the Fifth Avenue Coach Company, is an applicant for a bus franchise for Manhattan.

Depreciation Credit Systems Made Uniform in Washington

The Capital Traction Company, Washington, D. C., has been ordered by the Public Utilities Commission to change its system of accruing depreciation so that it will conform to the method tentatively adopted in the commission's valuation order of 1919. The order was issued as a result of a conference with officials of the company.

In 1919, when the commission laid down a rule for depreciation, various terms of obsolescence were fixed for the respective items of the equipment of the railways, which resulted in a bookkeeping charge roughly averaging 2.52 per cent of the total value. The same year, and again in 1920, the Capital Traction Company increased its depreciation reserve so that it finally became about 3 per cent. The Washington Railway & Electric Company made no change in its system of accounting for depreciation so that the commission's order makes the method of accruing depreciation uniform.

Passenger Figures at Madison

Figures filed with the Railroad Commission of Wisconsin by the Madison Railways, show that for the first ten months of the year the company carried 325,158 railway passengers compared with 325,665 for the similar period in 1925. However, 32,100 motor coach passengers were carried up to the first of November this year, compared with only 11,537 during the corresponding months last year.

The report on October business reveals that while the number of street car passengers fell off as compared with the 1920-1924 four-year average, the total of street car and motor coach passengers carried in October, 1926, was 531,105 as against 528,388 in October, 1925, an increase of 2,717. Other figures on the Madison Railways business for October, 1926, follows:

Total railway passengers, October, 1926, 479,473; railway passengers for the four-year average, 1920-1924 (average), 572,565; gross railway and motor coach revenue, October, 1926, $36,295; gross railway and motor coach revenue, October, 1925, $36,077, an increase of $218.

Unification of Lines in Hannibal

Controlling interest in the Hannibal Railway & Electric Company, Hannibal, Mo., has been purchased by stockholders of the Hannibal Transportation Company, operating the city bus company. The properties will be unified on Jan. 1 with an interchange of transfer and transportation facilities. Under the new ownership officers of the Hannibal Railway & Electric Company are: Frank T. Hodgdon, president; Carl D. Sultzman, vice-president; Dan H. Hafner, Jr., secretary, and S. O. Oserhout, treasurer. Clair Mainland remains as general manager of the company. Carl D. Sultzman is president of the Hannibal Transportation Company; Dan H. Hafner, Jr., secretary, and S. O. Oserhout, treasurer. The electric railway recently sought permission to curtail service.

Lincoln Ready to Relinquish Railway Lines

The Lincoln Water & Light Company, Lincoln, Ill., has notified the City Council that within six months it will relinquish operation of the railway, originally a municipal project. After the city failed to operate the lines at a profit, they were taken over by the Lincoln Water & Light Company with provision that either could cancel the contract on six-months notice. A few months trial convinced the utility that the lines could not be made to pay.

Orders Abandonment of Kite Route

Judge J. Foster Symes, in the federal district court at Denver Col., Dec. 10, instructed W. H. Edmunds, receiver of the Denver & Interurban Railroad (Kite Route), operating between Denver and Boulder, to cease operation of the railroad. The court's order was the result of the suit brought by the Guaranty Trust Company, New York, trustee, representing the holders of $1,250,000 in bonds, on which interest is in default, and the further proof that so far this year the road has been operated at a loss of $57,000, with a cumulative loss of $75,000 during the past five years.

The date for cessation has not been announced. The owner, the Colorado & Southern Railroad, is operating its steam trains daily as well as a bus line between Denver and Boulder.

In passing upon the contract between the electric line and the city of Boulder, the court said such contract did not bind the road to operate at a loss. Attorneys for the city of Boulder told the court that it had unlimited power to issue receiver's certificates and should do so to keep the road in operation. The court answered that it did not so understand the law and that there was no visible means of the road improving its earning power. The contract mentioned expires in June, 1927.

Will Seek Tax Reduction.—The city of Hutchinson, Kan., will not take over the Hutchinson Interurban Railway and operate it as a municipal utility although the company is about to be sold because of failure to pay back taxes. The City Commission was considering taking over the railway and operating it, but finally decided to make an appeal to the State Tax Commission for the reduction of assessments. The system now is operating under a trustee for the bondholders.

Railway Traffic to Be Rerouted.—Mayor Jermyn of Scranton, Pa., recently announced that the Scranton Railway had agreed to carry out its part of a rerouting program and had made provision in its 1927 budget for the work. The scheme is to be tried out for some time before any of the proposed abandoned tracks are removed. This rerouting of street car traffic in the central part of the city has been suggested as an aid in eliminating much of the traffic congestion.

Would Issue Common Shares.—For the purpose of reimbursing its treasury for money which it said it had spent out of its current income, the Interstate Public Service Company of Indianapolis, Ind., an Insull utility, has asked the Indiana Public Service Commission for authority to issue 8,370 shares of common stock of no par value. It expects to derive $627,716 from the issue. The money was spent, the petition said, to make up deficiencies for refunding purposes for which a $7,384,900 refunding bond issue was approved by the commission on Dec. 7.

Additional Issue Offered.—A syndicate headed by Harris, Forbes & Company is offering at 97 and interest, yielding about 5.20 per cent, an additional issue of $7,500,000 Illinois Power & Light Corporation first and refunding mortgage gold bonds. The series, known as "C," 5 per cent thirty years, is dated Dec. 1, 1926, and is due Dec. 1, 1956.

Authorized to Sell Bonds.—The Key System Transit Company, Oakland, Cal., has been authorized by the California Railroad Commission to issue and sell for cash on or before April 30, 1927, at not less than 96 per cent of face value, plus accrued interest, $1,500,000 of its series "D" first mortgage 6 per cent bonds, due July 1, 1938, and to use $770,161 of the proceeds to reimburse its treasury for expenditures for additions and betterments.

Substitutes One Line for Another.—The Sacramento Northern Railway, Sacramento, Cal., has been authorized by the Railroad Commission to discontinue railway service and to abandon and remove its tracks and equipment on its Park Avenue, Sixteenth, Mulberry Streets branch and to substitute in place thereof an extension of its Sixteenth Street line to Twentieth Street.

Track Abandonment Approved.—The abandonment of car tracks on Indiana Avenue in Toledo, Ohio, sought for several years, has been approved by the City Council at its meeting Dec. 6. Provision is made that the tracks must be removed before April 1, 1927. The line was one of those running into a territory which was considered to have adequate service from parallel routes.

Would Abandon Interurban. — The Portland Electric Power Company has filed with the Public Service Commission of Oregon a petition asking for permission to discontinue its interurban railway service between Montavilla and Troutdale by way of Ruby Junction. This division, the company claims, has been a money loser for years and shows a deficit of $34,074 for the first ten months of 1926. The steady decline in revenues in this territory is said by the Portland Electric Power Company to be directly attributable to bus and truck lines which have established service on the route. The company is faced with the need for rehabilitating the road physically, and says the expenditures that would be necessary for this purpose are not warranted by prospective business.

Increased Patronage Reported.—For the first time in weeks the report of the Omaha & Council Bluffs Street Railway, Omaha, Neb., shows an increase. The last nine days in November, as reported to the Nebraska Railway Commission, show a 2.16 per cent increase in the number of passengers carried over the corresponding period of 1925, the respective figures being 1,428,400 in the year 1926 and 1,398,106 in the year 1925.

Conspectus of Indexes for December, 1926

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen, conductors and operators on 137 of the largest street and interurban railways operated in the United States, weighted according to the number of such men employed on these roads.

James H. McGraw Honored

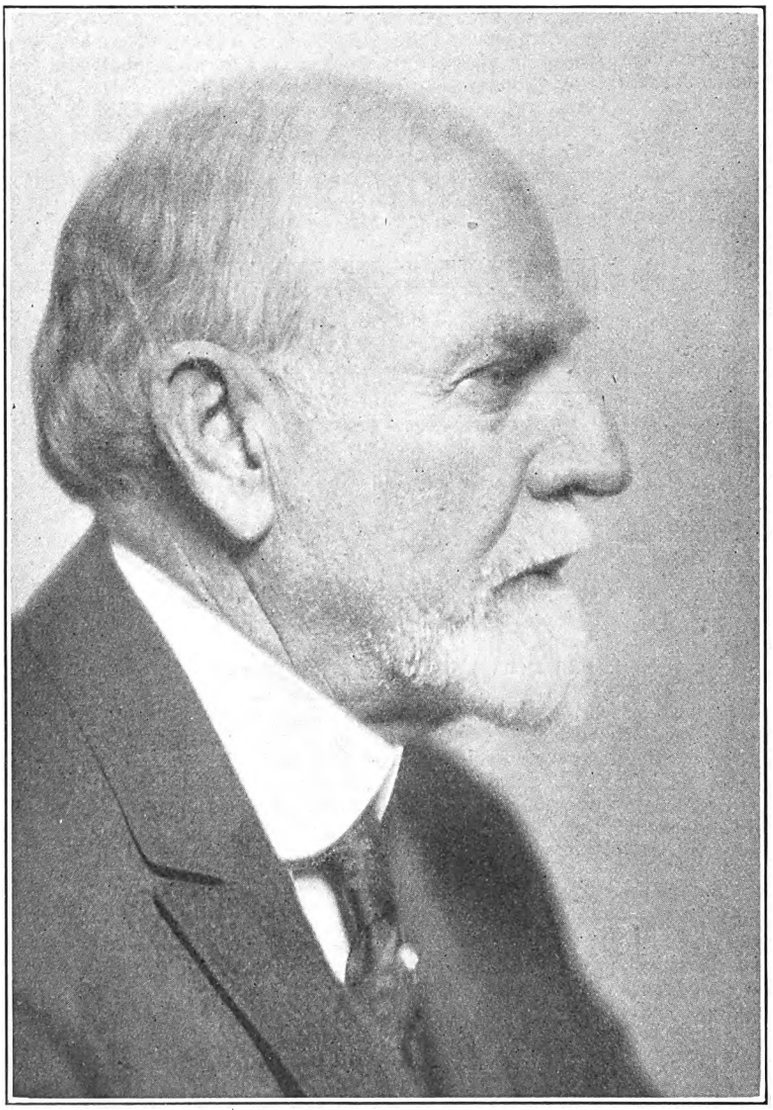
Tribute Paid to Him by Engineers, Industrialists, Educators, Business Associates and Others in Recognition of His Work for Technical and Business Journalism

MORE than 1,000 representative men engaged in engineering, education, publishing and other callings attended a dinner at the Hotel Astor, New York, on Friday evening, Dec. 17, arranged as a tribute to James H. McGraw as a publisher, a leader of industry and a man. The immediate occasion was Mr. McGraw's 66th birthday anniversary, which coincided with the completion of more than 41 years of activity in the field of industrial and technical publishing. In this period the McGraw-Hill Publishing Company, Inc., of which he is president, has grown from small beginnings to its present magnitude.

John W. Lieb, vice-president New York Edison Company, was toastmaster. Before he called on the speakers chosen to represent various business and professional interests, Mr. Lieb sketched Mr. McGraw's career briefly, dwelling for a minute on the comprehensive nature of the McGraw-Hill publications, which, he pointed out, were not confined to the electrical field but covered nearly all branches of engineering and the general interests of industry.

Willits H. Sawyer, president of the American Electric Railway Association, was the first speaker. He told what Mr. McGraw's counsel and leadership had meant to the electric railway industry, recalling that the publisher's first journalistic venture had been in the street railway field 40 years ago. This industry, he said, in spite of temporary adversity, must and will go forward. The McGraw-Hill papers have pointed the road to constructive co-operation and co-ordination in the transportation field. He called the guest of the evening a "fountain of well-directed enthusiasm" and read a testimonial to him on behalf of the A.E.R.A., in substance as follows:

> The electric railway industry appreciates that as head of the largest industrial paper publishing house in the world James H. McGraw is an outstanding, commanding figure in the industrial life of this nation, but we of the electric railway industry regard him as signally our own. Practically since the first of our industry he has been a guilding influence and has given to us largely and extensively of his wise and helpful leadership. His far-seeing vision, his unwavering confidence in our industry, his constructive policies have been the foundation stones upon which we have builded. No one among us has been more insistent that the changed condition of to-day should be met by moderized equipment. At all times he has zealously urged us to sell worth-while, desirable service and freely to utilize frank, attractive publicity, especially of late years when our industry has been pressed by seemingly insurmountable difficulties. His confidence and his guidance have been both a challenge and an inspiration. Over the period of the last 40 years no other man affiliated with our industry has been more of an inspiration or has contributed more to its upbuilding and progress.



JAMES H. McGRAW

Gen. Guy E. Tripp, chairman of the board of directors of the Westinghouse Electric & Manufacturing Company, who was called on to represent the manufacturing interests, refused, in a witty speech, to "catalog" Mr. McGraw, but referred to him as a "practical philosopher." Idealism was one of the foundation stones on which the publisher had built. General Tripp suggested that engineers were not sufficiently tolerant of the imaginative and romantic element in their calling. Had they grasped more fully the opportunities to interest the public in this aspect of their work, he thought that Governor Pinchot's visualization of "giant power" and Professor Ripley's attack on holding companies might have lost much of their popular appeal, for the public would have had a sounder conception of superpower and would understand that the holding company is the only feasible instrument by which its advantages can be realized. The speaker suggested in a semi-humorous vein that Mr. McGraw start a new publication devoted to the sociology of business.

Charles L. Edgar, president of the Edison Electric Illuminating Company of Boston, spoke for the light and power industry. He dwelt on the relation between journalism and the industry; he praised the *Electrical World* for its unbiased and open-minded attitude toward all electric light and power problems. Mr. McGraw, the speaker said, had the faculty of making the busy leaders of the electric light and power industry contribute in their turn to the papers he publishes, drawing from these leaders their best thought. He was an outstanding example of the spirit of co-operation.

A scholarly address was contributed by Dean Dexter S. Kimball of the College of Engineering at Cornell University, speaking for engineers. He emphasized the superior endurance of the written word as compared with that merely spoken, and associated Mr. McGraw and the publications of his company with the spirit of engineering and science. For the first time in the world's history, Dean Kimball said, hope of universal well-being is held out to a great nation. The problems of production had been solved in the main; those of distribution were not yet entirely worked out. In their solution and in the promotion of engineering knowledge, for which the people were now eager, and the development of the economic side of industry, the publications of Mr. McGraw were taking a noteworthy part.

Edward J. Mehren, vice-president McGraw-Hill Publishing Company and chairman of the editorial board of the company, spoke for Mr. McGraw's asso-

Digitized by Google

ciates in business, dwelling on the principles that the publisher had set up to govern his technical, trade and industrial papers. These papers, he said Mr. McGraw desired to be collectors and distributors of information, interpreters of events and trends in their respective industries and promoters of sound thought and policy. Imbued with an intense spirit of service, Mr. McGraw possessed faith illumined by vision, courage and perseverance. He insisted on a superior product, minute specialization, intimate contact with leaders in the field and intense application characterized by hard work and sacrifice. Mr. Mehren concluded with this tribute to his chief:

HIS EFFORT TO BUILD AN INSTITUTION

"That he might build an institution that could valiantly serve engineering and industry, that could help lead them to higher ideals and greater effectiveness, that could help solve their baffling problems, that could make them better agencies for engineers, owners, managers, employees and the general public, whom, in the last analysis, we all serve—such has been his ambition, such has been his very life."

Responding to the call of the toastmaster, Mr. McGraw thanked his audience for the tribute paid him, but insisted that the leaders of industry who so honored him were themselves worthy of commendation, for without their co-operation his efforts would not have borne fruit.

"It is beyond me adequately to express my appreciation of this tribute," said Mr. McGraw.

"That there has been a certain accomplishment your tribute forces me to admit. I wish that the accomplishment might have been larger and that the service rendered to you, your professions and your industries might have been even more intimate and effectual. But whatever the accomplishment, it would not have been possible without the ardent co-operation of two important groups:

"The first of these consists of my own loyal and competent associates in the McGraw-Hill Publishing Company, the McGraw-Hill Book Company and their subsidiary organizations.

"The second group which has been essential to whatever accomplishment there has been is composed in their entirety of the professions and industries which you represent. It has always been my thought that our publishing enterprises, both magazines and books, have been an intimate part of the professions and industries.

HIS GRATITUDE TOWARD OTHERS

"A great satisfaction that I take out of this evening's meeting is that it gives me an unusual opportunity to express in this public way my gratitude to the engineers and industrialists of America for the parts they have played in making possible McGraw-Hill magazines and McGraw-Hill books. Without you, our work could not have been done. Without you, our institutions could not have existed. I thank you heartily for your help, and believing, as I do, that our institutions can be of still larger service, I pray your co-operation for the future.

"We have never wanted to stand alone in any effort if other agencies could help, nor did it matter whether we or some one else originated the idea. Our part would be played as vigorously in the one case as in the other. We have, therefore, co-operated with all agencies which have worked in a forward-looking attitude for the advancement of the engineering profession and industry; we have co-operated with the engineering societies, national and local with trade and industrial associations of every kind; with government agencies; with research bureaus."

Of his association with men in industry, Mr. McGraw said that the engineers and industrialists with whom he had worked had remade the physical conditions of the civilized world in these 40 years. "To work with you, and the thousands of your fellows whom you represent tonight, has been a source of constant inspiration," he said. "To serve you, to help you in your developments in engineering and industry has been an inestimable privilege."

In conclusion Mr. McGraw said: "For the privilege of having served in this ministry I have you to thank, for your co-operation has made it possible. With all my heart I thank you for the privilege. With all my heart I thank you for your tribute this evening."

At the speakers' table, besides the guest of honor, were Arthur Williams, chairman of the dinner committee; Charles L. Edgar, Thomas E. Murray, Walter R. Addicks, Gerard Swope, M. S. Sloan, W. W. Freeman, E. M. Herr, Frank W. Smith, Willits H. Sawyer, Edward J. Mehren, Dexter S. Kimball, Guy E. Tripp, Philip G. Gossler, Martin J. Insull, William L. Ransom, H. M. Edwards, Robert Ridgway, George S. Davison, E. H. Rosenquest, Calvin W. Rice, Fred R. Low, John V. W. Reynders, A. L. Salt, Philip Torchio, J. Waldo Smith, George F. Kunz, C. Stanley Mitchell and Newcomb Carlton.

Mr. Williams read a telegram from Thomas A. Edison, honorary chairman of the committee, expressing regret at his inability to be present, and similar telegrams from Judge E. H. Gary, Secretary Hoover, Secretary of War Davis, John Hays Hammond and others.

Personal Items

Changes in New Jersey Personnel

Under a rearrangement of positions in the transportation division of Public Service Railway, Newark, N. J., Louis P. Baurhenn, now general superintendent, becomes director of personnel; Arthur T. Warner, now assistant to the vice-president in charge of operation, becomes general manager in charge of traffic, and Martin Schreiber, now manager of the southern division of the transportation lines, becomes general manager in charge of plant of the entire system. All three are newly created positions and the three heads will report to M. R. Boylan, vice-president of the Public Service Railway and the Public Service Transportation Company.

George A. Rothery, chief assistant in the Camden offices, will succeed Mr. Schreiber as southern division manager, and Claude L. Sell, superintendent of employment at the same office, will become assistant manager.

Mr. Warner entered the employ of the Public Service Railway June 27, 1910, as a cadet engineer five days after he was graduated from Lafayette College as an electrical engineer. His first job was in the pits at the Newark car shops. He was made traffic engineer Jan. 1, 1916. He became assistant to Mr. Boylan when the latter was made acting general manager in 1923. He is president of the public service section of the American Electric Railway Association.

Mr. Schreiber was graduated from Ohio State University with the degree of mechanical and electrical engineer. His first street railway experience was with the Cleveland Electric Railway as an electrician. He was appointed manager of the southern division of the Public Service Railway on Sept. 1, 1920. As chief engineer he was in charge of the construction of the Public Service Terminal building in Newark.

Mr. Baurhenn began railway work with a New Orleans company. In 1900 he went to New Jersey to become general shop foreman in charge of transportation of the Bergen County Traction Company at Edgewater. When the New Jersey & Hudson River Railway & Ferry Company took over the Bergen County Company Mr. Baurhenn became superintendent and purchasing agent of the new company and continued after the Public Service took over the latter company in 1911. In August, 1918, he was made assistant general superintendent and on Dec. 1, 1923, general superintendent.

New Personnel on Ogden Property

M. E. Singleton is president of the Utah-Idaho Central Railroad, Ogden, Utah, which recently passed to new owners. Mr. Singleton is president of the Missouri State Life Insurance Company, St. Louis.

A. B. Apperson is executive vice-president of the Ogden property. He is a railroad man and coal operator of Denver. Joseph Scowcroft is vice-president.

Howell Ellis, secretary of the Indiana Public Service Commission since April, 1925, has been appointed a member of the commission to succeed Samuel R. Artman, who was named by Governor Jackson to membership on the State Industrial Board. The appointment is for the unexpired term which ends next May. Before he joined the commission Mr. Ellis covered statehouse news for the Indianapolis *Star*.

Pittsburgh Plan Operating

Messrs. Loftis, Fink, McCarthy, Bull, Leschke and Williams in New Rôles in Departmental Activities

THE new form of railway supervision, based upon a policy of making each executive assume entire responsibility for his own departmental activities, is now functioning in the Pittsburgh Railways, Pittsburgh, Pa. Approval of this plan, which solidifies and systematizes the entire structure of the organization, was referred to in the ELECTRIC RAILWAY JOURNAL, issue of Nov. 6, 1926, page 866.

In this new scheme, J. M. Loftis, veteran superintendent of transportation, has been placed in charge of three distinct functions of street railway transportation, namely, traffic and schedule, car operation and trainmen's instruction, with a superintendent appointed to head each branch. A. J. Fink, formerly assistant to the general manager, has been appointed superintendent of traffic and schedules, with the responsibility of keeping the street cars moving and seeing that the service is carried through. Frank W. McCarthy, who was formerly assistant superintendent of transportation, has been placed in charge of car operation, with the additional task of supervising the activities of the men at the carhouses.

J. M. Loftis

Another, so far unchosen, will be made superintendent of trainmen's instruction and will have charge of training along lines of proper handling of cars, safety and courtesy.

W. T. Rossell, in announcing the reorganization of the transportation department, also announced a reorganization and simplification along similar lines in the mechanical department. Hitherto, in this department, the duties were handled through assistants, but under the present plan one man will definitely have charge of each branch, with closer supervision and increased responsibility.

Direction of both carhouse and shop equipment has been placed in the hands of Richard S. Bull, who was formerly shops superintendent, while all track, right-of-way, buildings and other structures will come under the charge of Oscar Williams, with the title of superintendent of way and structures. A. H. Leschke, formerly maintenance engineer, is now operating engineer, with jurisdiction over both transportation and maintenance, and M. W. Cooke, formerly chief of current control, has been appointed superintendent of power and inclines.

It is believed that with this new method of grouping all of the duties of the departments and allocating them under one head a closer supervision, with a consequent greater efficiency, will result. Brief biographical facts of the new incumbents follow:

CAREERS OF NEW INCUMBENTS REVIEWED

J. M. Loftis, in charge of transportation, started on his railway career in Wheeling, W. Va., in 1888. In October, 1889, he went to Pittsburgh with the Citizens Traction Company, one of the underlying companies of the Pittsburgh Railways, and served in the capacities of track repairman, power house repairman, watchman, gripman on the cable road, dispatcher, inspector, division superintendent and superintendent of transportation.

He was born in Randolph County, West Virginia, and attended public schools there. As a boy he worked in the lumber woods and later in the steel mills.

A. J. Fink, who will report to Mr. Loftis, went to Pittsburgh in 1920 to become associated with Mr. Fitzgerald, who at that time was consulting engineer for the Philadelphia Company working on the reorganization of the Pittsburgh Railways. After the reorganization of the railways in February, 1924, Mr. Fink was appointed assistant to general manager, in which capacity he served until November, 1926, when he was appointed to his present position of superintendent of traffic and schedules.

Mr. Fink was born in Cincinnati, Ohio, and was educated in the Cincinnati schools. In 1905 he entered the service of the Cincinnati Traction Company, being employed in the operating department until the early part of 1920.

A. J. Fink

F. W. McCarthy, another superintendent under Mr. Loftis' supervision, has been identified with Pittsburgh tractions since 1898, when he entered the employ of the United Traction Company in 1898 as cashier. When the United Traction Company was taken over by the Pittsburgh Railways in 1902 he became clerk to the superintendent of the Second Avenue division. The same year he was transferred to the general office, to a position of

F. W. McCarthy

R. S. Bull

A. H. Leschke

Oscar Williams

Digitized by Google

clerk to superintendent of transportation. Mr. McCarthy was appointed secretary to the president in 1907 and assistant superintendent of transportation in 1913. On Nov. 1 last he was appointed superintendent of car operation.

Richard S. Bull, the new superintendent of equipment, entered the employ of the Pittsburgh Railways on Oct. 1, 1906. He started as a meter reader, from which position he has steadily advanced through the various stages of draftsman, assistant superintendent of overhead lines and engineer of car equipment, to the position of superintendent of equipment, having jurisdiction over the shops and carhouses of the Pittsburgh Railways.

Mr. Bull received his early education in the public schools of New Hartford, Conn., his birthplace, and the Gilbert high school at Winsted, Conn. He was graduated from Pratt Institute, Brooklyn, in 1906. Mr. Bull's first position after completion of his engineering course was with the United Switch & Signal Company as an apprentice. He remained there only a few months, and then entered the service of the Pittsburgh Railways.

A. H. Leschke, who will serve in both the transportation and maintenance departments, has been connected with both steam railroads and electric railway enterprises. His first position was with the Baltimore & Ohio Railroad, as a student employee, and he subsequently held various positions in the operating vice-president's department. His work was interrupted by the World War, in which he enlisted in the army as a private in 1918 and rose to the rank of first lieutenant in the Engineering Corps. At the close of the war Mr. Leschke returned to the employ of the Baltimore & Ohio Railroad. On Jan. 1, 1921, he entered the commercial development department of the Philadelphia Company as an investigator, later becoming statistician in the office of the financial assistant to the president. In February, 1924, he was made research engineer in the newly organized research department of the Pittsburgh Railways. In July, 1925, Mr. Leschke was appointed maintenance engineer in the maintenance department, and on Oct. 1, 1926, was promoted to the position of operating engineer in the operating department.

Mr. Leschke was born in Hartford, Conn., and attended the grammar schools and high school of that city. He entered Trinity College, Hartford, and later went to the University of Wisconsin, from where he was graduated in the civil engineering course.

Oscar Williams, superintendent of way and structures, entered the service of the Pittsburgh Railways in 1901 in the engineering department as rodman. He rose steadily, becoming supervisor of interurban lines in 1911, supervisor of Pittsburgh and Rankin lines in 1919, superintendent of maintenance in 1924 and a year later superintendent of way. This year he was promoted to the position of superintendent of way and structures.

Mr. Williams was born in Cleveland, Ohio. He received his early education in Pittsburgh schools and in the Central high school.

Buses on the "Air"

Frank Weitz of Lang Body Company Gives a Radio Talk on Development of the Bus Industry

"Bus Transportation" was the subject of a ten-minute radio talk which was broadcasted from station WHK at Cleveland, Ohio, on Thursday evening, Dec. 9, by Frank Weitz, head of the research and experimental department of the Lang Body Company. It was one of the first occasions, if not the pioneer, that this subject had been brought to the attention of the public in such a fashion. Significant was the fact that Mr. Weitz, in tracing the history and development of the bus industry, made it very clear that it is in the field of co-ordinated transportation that the bus has found its greatest sphere of usefulness.

In addition to the talk by Mr. Weitz, the Lang Body Company orchestra played a number of selections. Telegrams and letters from various sections of the country have been received by the sponsors of the program, commending both the orchestra and the speaker upon the excellence and interest of their respective contributions.

First tracing the growth of the transportation industry in this country from its humble beginnings in the days of the stagecoach, Mr. Weitz pointed out the tremendous advances which have been realized in the relatively few years just past by electric and steam railways, and he indicated that the next decade will show even greater progress in modernization work.

Bus Has Rapidly Fitted Itself Into Transportation Scheme

The speaker next discussed the manner in which the bus has established its importance as an aid to flexibility in transportation service:

> Great as the development of the steam and electric roads has been, they have been unable to cope with the ever-increasing demands of our rapidly growing and spreading cities and towns. The enormous cost of trackage, right-of-way, power house equipment and other items incidental to the expansion of steam and electric roads have resulted in creating an imperative need of a more flexible form of transportation—a form of transportation that could at a reasonable cost reach those who have established homes in localities far removed from existing steam and electric lines. This need for a flexible and economical mode of transportation has been filled by the use of motor coaches or buses.
>
> In our modern city today street car service has been supplemented by motor bus or coach service and we reach with ease the most isolated and otherwise inaccessible parts of our suburban and outlying communities. Many independent bus operators reach out into our more distant neighboring cities or towns and there has been developed a network of transportation lines which serve us for our every requirement.
>
> Those accustomed to riding in their own private cars, who have not as yet experienced the thrill and comfort of riding in the modern bus of today, will find quite a surprise in store for them. Those living in the city will find it convenient, comfortable and safe to use bus transportation; the hazard and responsibility of operating your own car and the annoyance of finding suitable parking space when shopping or attending the theater are eliminated. The suburbanite, when using the intercity bus with its comfortable, luxurious seating capacity, will find it is more convenient and more restful than using his own private car.
>
> Electric railways today are operating approximately 6,400 buses, which include both the city and intercity types. Motor bus transportation has invited and brought to it new patrons, among them the traveling salesman, who has noticeably increased his sales volume because the bus enables him to reach isolated points in a very short space of time. The motor bus takes him wherever he wants to go with the least possible inconvenience and loss of time.

After citing a large number of steam railroads and electric railway properties which have entered the bus operating field on a comparatively large scale, Mr. Weitz concluded his remarks with a tribute to various manufacturers of bus equipment, as follows:

> Among those who have been most prominently identified in building bus transportation more efficiently, both from the standpoint of economy to the operator and safety to passengers, are such companies as International Harvester Company, American Car & Foundry Motors Company, Fageol Motor Car Company, Mack-International Motor Truck Corporation, Yellow Truck & Coach Manufacturing Company and the White Company. The Lang Body Company has been identified with all these companies in developing the highest possible type of bus body equipment.

Modern Gear Case Manufacturing

Since its fire last August the Chillingworth Manufacturing Company, Jersey City, N. J., has remodeled its gear case plant and is now manufacturing on a 24-hour daily schedule. The company states that the new machinery and methods which have been recently introduced will augment its ability to manufacture more economically than heretofore by increasing production and permitting more rapid shipments. Modern lighting and heating systems have been installed and a complete set of checking devices provided. On the latter all cases are fitted before shipment and the Chillingworth company feels that it now has one of the most modern and best-equipped gear case factories in the country.

The process of drawing a single sheet of soft steel in the shape of a gear case half has been in use by the company for several years, but it has recently incorporated into this process modern methods of heat treating the steel after it has been drawn into shape. This modification of the process has met with the approval of experts conversant with the best practice for annealing steel. The chief object of this annealing process is to insure a structure of the steel that is particularly required in gear case service, which demands a soft, pliable and tough material.

An invitation has been extended by the Chillingworth company to any users of gear cases who would be interested in observing the manufacture of drawn steel cases.

B.-M. T. Will Purchase 50 Triplex Articulated Cars

New York Rapid Transit Corporation Charges that the City Has Failed to Comply with Its Obligations to the Company in Withholding Construction of Additional Subway Lines and the Coney Island Shops

WHEN the New York Transit Commission met on Dec. 21 to conduct a hearing on the proposed order to force the purchase of 50 new steel cars by the Brooklyn-Manhattan Transit Corporation it was learned that the need for the hearing had been obviated. W. S. Menden, president of the New York Rapid Transit Corporation, subway-operating subsidiary of the B.-M.T., announced that the company would accept the commission's direction and purchase the cars in the form of 50 triplex units, similar to the articulated equipment now in experimental use on the lines.

Yet all was not smooth upon the surface of this acceptance. Mr. Menden, in a letter to the commission, charged that the city had flagrantly disregarded its agreements which had been definitely contracted for with the company and had failed to construct the Nassau Street subway, complete the Fourteenth Street-Eastern District subway or to supply shops within a reasonable period after the signing of the contract. He declared that the Coney Island shops, which are under construction, were still uncompleted fourteen years after the signing of the contract. He also said because of the lack of shop facilities the company now was forced to keep on freight cars equipment for 67 triplex cars previously purchased by order of the commission, at an expense of $100 a day for demurrage.

Some Wooden Cars Will Be Replaced by Earlier Order of Equipment

In spite of the fact that the city, copartner with the rapid transit company in all new construction work, has allegedly failed to meet its obligations, the B.-M.T. agrees that the new cars will be obtained at the earliest possible date and will further serve to eliminate the unsafe wooden units now in operation. This replacement program will be given considerable impetus by the group of 67 articulated units which were ordered some time ago and which are now awaiting assembling in the Coney Island shops. The Transit Commission has repeatedly avowed its intention to do away with the operation of wooden cars just as rapidly as new steel equipment may be obtained. However, the commission has called the attention of the public to the fact that wooden cars are of necessity used on the various bridge lines of the B.-M.T. where the structures are not strong enough to permit the operation of steel cars.

Mortimer B. Hoffman, counsel for the B.-M.T., announced that half of the new order would be ready for assemblage at the shops as soon as assembling work on the 67 units ordered at the direction of the commission nearly a year ago is completed. This is expected to be in June, at the latest. He stated that the second half of the order now to be placed should be completed by Dec. 31, 1927.

Power Show Exceeds All Past Records

Attendance at the fifth National Exposition of Power and Mechanical Engineering reached the hundred thousand mark. The exposition was held, as usual, in the Grand Central Palace, New York City, the date this year being Dec. 6 to 11, inclusive, and considerably exceeded similar functions in the past in the magnitude and variety of materials exhibited.

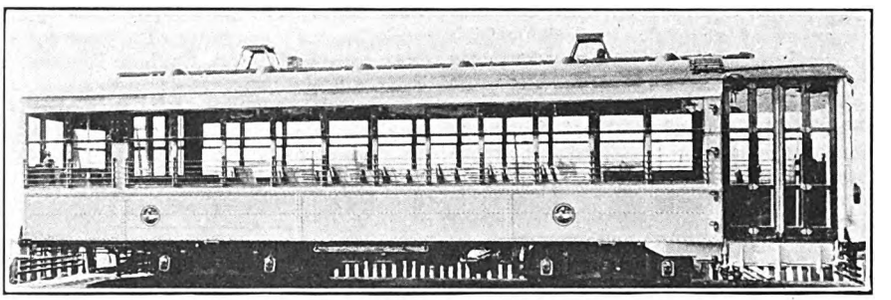
Four hundred and ninety manufacturing firms were represented on the four floors of the building and the exhibit covered practically every phase of the power generating and mechanical engineering fields. A considerable improvement was noted in the methods used by exhibitors in displaying their apparatus.

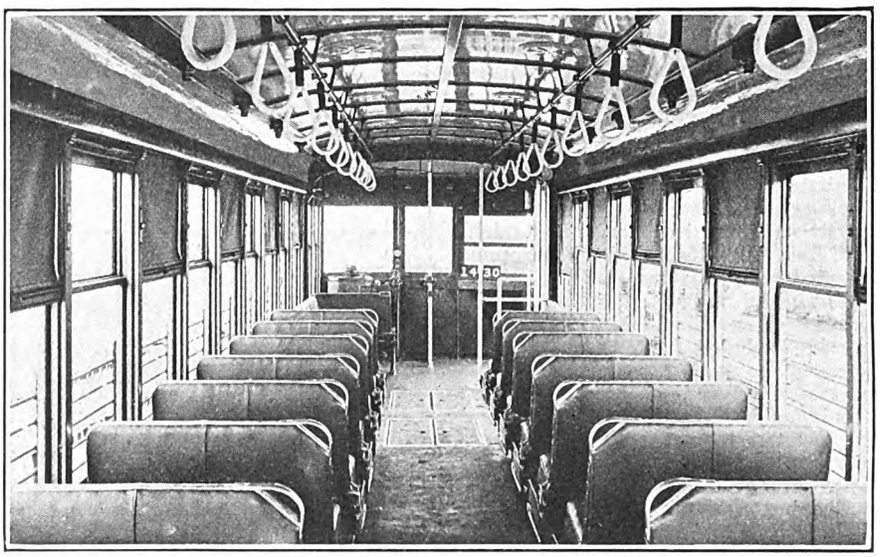
The tremendous influence that welding is having on all types of mechanical equipment was shown by a large number of exhibits of the various types of welding equipment and by a very large number of products manufactured by the welding process.

Many new types of furnaces and boilers were shown. Problems of valve operation were well illustrated and the use of stainless steel trimmings and monel metal trimmings in this field was featured by a large number of exhibitors. Machine tools and various types of shop equipment were amply displayed and the most improved methods for heating, illuminating and ventilating shops and factories were outlined.

Plans are already under way for the holding of the sixth Power Show from Dec. 5 to 10, 1927. The advisory committee which assisted the management in the conduct of the 1926 exhibition consisted of I. E. Moultrop, chairman; W. L. Abbott, Homer Addams, N. A. Carle, W. H. Driscoll, Fred Felderman, C. F. Hirshfeld, O. P. Hood, L. H. Jenks, E. B. Katte, R. T. Kent, John H. Lawrence, Fred R. Low, David Moffatt Myers, R. F. Pack, Fred W. Payne, H. B. Reynolds, Calvin W. Rice and Charles F. Roth.

One of Eight New Street Cars Now Operating in St. Petersburg, Fla.





The Municipal Railway received its new rolling stock in November and has recently placed the units in regular service. They were built by the American Car Company of St. Louis, Mo., and the principal specifications appeared in the ELECTRIC RAILWAY JOURNAL Dec. 4, page 1032.

Simplified Classification of Scrap

Tentatively Adopted Specifications for Iron and Steel Scrap Now Available in Pamphlet Form

Of real value to railways having quantities of iron and steel scrap to dispose of will be the specifications for different classes of scrap which have just been issued by the National Committee on Metals Utilization in its report to the Bureau of Standards of the United States Department of Commerce. The general campaign for elimination of industrial waste has been carried on for four years by the Division of Simplified Practice of the Department of Commerce, and this particular phase of the work, the simplification of scrap classification, was undertaken about three years ago. Formerly, as stated in the pamphlet just issued, iron and steel scrap has been bought and sold under different classifications which were drawn up to meet the convenience of individual interests, which compelled the dealer to use different classifications to meet the requirements of his various customers. Similarly, when buying scrap the dealer was forced to accept his material according to the classifications under which it was sold to him. This condition caused unnecessary confusion and attendant misunderstanding and loss.

At the present time all classes of scrap have been gathered together into a number of general categories which are designated according to the uses for which they are intended For example, there are the classes of scrap which will be used in blast furnaces, those intended for use in basic open-hearth furnaces, those for use in acid open-hearth furnaces, those for electric furnaces, for gray iron foundry practice, etc. As an example of the specification for scrap under each general classification, the category for use in blast furnaces consists in part of the following:

1. Pipe busheling scrap—Iron and steel pipe and flues (clean), bedstead tubing and similar material cut 8 in. and under in length, free from galvanized material and foreign metals.

2. Mixed borings and turnings—Clean, short steel and wrought iron turnings, drillings, screw cuttings and cast or malleable iron borings and drillings, free from stringy, bushy, tangled, corroded material, lumps, excessive oil, scale, other metals, dirt or foreign material of any kind. Alloy steel scrap may be excluded from these specifications by mutual agreement between buyer and seller.

Included in the pamphlet is a standard contract form for the purchase of scrap which was drawn up at the instigation of the National Association of Purchasing Agents.

These iron and steel scrap classifications have been accepted by the American Electric Railway Association and many other associations and by a large number of individual manufacturing companies. They have been accepted in "principle" by various associations, trade journals, technical societies and organizations approving of the general purpose and program of waste elimination. Among these is the ELECTRIC RAILWAY JOURNAL.

Copies of the pamphlet may be obtained from the superintendent of documents, Government Printing Office, Washington, D. C., at a cost of 10 cents each. Checks or money orders should be drawn in favor of the above-named official. Specifications and the standardized contract form for the purchase of scrap have been adopted for a period of one year, at the end of which time a revision conference will discuss and, if found desirable, modify the classifications. Suggestions and criticisms should be referred to the committee on iron and steel of the National Association of Purchasing Agents, of which H. C. Wickline, Union Steel Casting Company, Pittsburgh, Pa., is chairman.

Union Carbide Elects Two New Officers

W. F. Barrett has been elected to a vice-presidency of the Union Carbide & Carbon Corporation and G. W. Mead was made a director of the company at a meeting of the board of directors in New York on Nov. 23. Mr. Barrett began his association with the Union Carbide & Carbon Corporation in August, 1913, when he became works manager and chief engineer of the Linde Air Products Company, a subsidiary of the parent corporation. Mr. Mead has been identified with the company and its subsidiaries since 1906, when he was elected as the first secretary of the Union Carbide Company. Both of the officials have held many important positions with the Union Carbide & Carbon Corporation and its various subsidiaries and are at present officers and members of the boards of a large number of the companies.

Duluth and Indianapolis Will Use Johnson Fare Boxes

The Duluth Street Railway and the Indianapolis Street Railway have ordered 110 and 370 type D Johnson fare boxes respectively and will place these on all cars. These boxes register pennies, nickels, dimes and ticket tokens. They have two registering dials, one for cash fares and one for metal token ticket fares.

Metal, Coal and Material Prices

Metals—New York	Dec. 21, 1926
Copper, electrolytic, cents per lb.	13.35
Copper wire, cents per lb.	15.75
Lead, cents per lb.	7.80
Zinc, cents per lb.	7.47
Tin, Straits, cents per lb.	68.00
Bituminous coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$5.325
Somerset mine run, Boston, net tons	2.75
Pittsburgh mine run, Pittsburgh, net tons	1.25
Franklin, Ill., screenings, Chicago, net tons	1.75
Central, Ill., screenings, Chicago, net tons	1.375
Kansas screenings, Kansas City, net tons	2.30
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$6.00
Weatherproof wire base, N.Y., cents per lb.	17.50

Linseed oil (5-bbl. lots), N. Y., cents per lb.	11.3
White lead in oil (100-lb. keg), N. Y., cents per lb.	14.75
Turpentine (bbl. lots), N. Y., per gal.	$0.89

Rolling Stock

Toledo, Ohio.—Several of the newly remodeled cars of the 700 type have recently made their appearance on various lines of the Community Traction Company over which one-man cars are in operation. The modernized equipment has leather upholstery, new trucks, various provisions for eliminating noise and complete one-man safety devices. A large number of cars are to be similarly rebuilt in the general program of rehabilitation which the Community Traction Company has undertaken. The new arch-deck roof is a feature of the model cars. The work is being carried on at the Central Avenue carhouse in Toledo.

Track and Line

Memphis Street Railway, Memphis, Tenn., has started work on the extension of the Central-Poplar car line from Tucker Street to Florence Street. The extension, which is to cost $23,000, is to provide turn-back facilities on the Central-Poplar line that one-man cars may be installed. Work will be completed in about 60 days.

Tri City Railway, Davenport, Iowa., is erecting 1½ miles of new trolley line. This improvement will entail a total expenditure of $3,000 or more.

Trade Notes

J. M. Van Nieukerken recently joined the American Brown Boveri Electric Corporation at the Camden, N. J., plant as a railroad project engineer. Mr. Van Nieukerken is a graduate of the Delft Technical University in electrical engineering and was previously connected with General Electric Company, Ltd., Birmingham, England; British Westinghouse Electric & Manufacturing Company, Ltd., Manchester, England; Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., and the Cleveland Union Terminal Company, Cleveland, Ohio.

Baltimore, Md.—A corporation is being organized to authorize the manufacture and sale of several new types of car parts. Featured in the line will be the Suarez universal joint coupler, designed especially for articulated cars.

A. W. Scarratt has been appointed assistant chief engineer of the Hyatt Roller Bearing Company, Newark, N. J. Mr. Scarratt is well known in engineering circles through long association with the electric railway and power house engineering fields, as well as with tractor and power farm implement development. He was for many years with the Minneapolis Steel & Machinery Company, and before that spent eight years with the Twin City Rapid Transit Company, five years in the mechanical department and three in power house and electrical development work. Mr. Scarratt still retains the office of secretary of the Minneapolis Section of the Society of Automotive Engineers.

Recording Accomplishment

COMPLETION of the year 1926 brings to a close another volume of ELECTRIC RAILWAY JOURNAL. In the industry the year has been one of accomplishment. Men in the electric railway business are wide awake and are making progress.

This activity is reflected in the pages of the JOURNAL. They have been replete with information indicative of the new order of things. To illustrate the increase in activity, the index for volume 68, exclusive of title and explanatory pages, published in this issue, fills eighteen pages instead of the usual sixteen. This expansion has been necessary to cover adequately the widened range of subjects and items.

A glance through the index will show more than ever the wealth of material included in the JOURNAL and the thoroughness of treatment. Furthermore, it will show the accessibility to information provided through the careful selection of key words and cross-references, making the location of any article published in the past six months a simple matter. The JOURNAL is the medium for disseminating the best thought of the industry—the semi-annual index the key which keeps it always accessible to the industry.

The residential limited

Back from the tracks lies virgin territory as far as trolley invasion is concerned—and consciously so. The inhabitants of these semi-rural sections seek not the inconvenience, but the quietude, although inconvenience is theirs. The ordinary public conveyance is, through its disturbing element, most unwelcome.

Many traction companies are today following the modern trend by moving inoffensively into the suburbs, meeting their patrons and selling their service with luxuriously appointed coaches.

These gasoline parlor cars, bulky as they are, equipped with motors capable of developing speed to compete with electric road schedules, are giving traditional electric road safety through the security of Westinghouse Automotive Air Brakes.

The recognized leaders among builders of highway transportation have accepted Westinghouse Air Brakes as the method of retardation in keeping with modern speed, bulk, and perplexing traffic conditions that are detrimental to security and a sane service with physically actuated brakes.

Illustrated above is the new White, a recent 6 cylinder entrant into the field of highway transportation that is meeting favor among operators, and is, like its smaller brother the four cylinder 50-B, factory equipped with Westinghouse Automotive Air Brakes.

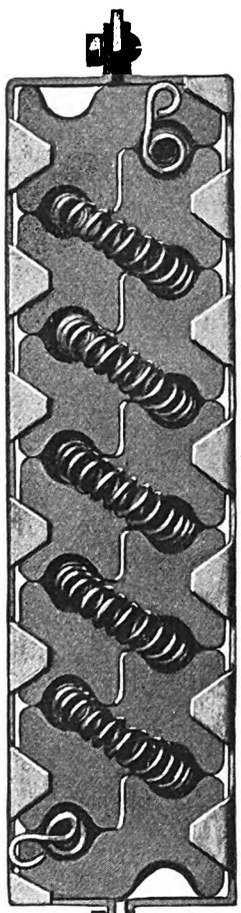
A Resistance Welder Of New and Better Design

Ample capacity, flexibility of control and a rigid arc-welded steel frame



NOT MERELY in one or two details, but throughout its construction is this new O-B Type LW Resistance Welder better built, for maximum reliability, safety, and continuity of service.

It is built of steel, on a unique sectionalized plan. Each of its 14 interchangeable resistance element units may be lifted out separately for inspection. They are arranged in two separate series-connected element blocks instead of in a single block, thus reducing voltage stress by half.

Insulation has been developed to such a degree that shorts and grounds are virtually impossible. And its special refractory porcelain insulators withstand the rapid changes in temperature without harm. In addition, the welder affords exceptional rapidity of heat dissipation. These properties, together with the strength of a rigidly braced, arc-welded steel frame, give you the maximum in possible service.

Use this portable machine for welding rail bonds, building up cupped joints, and for miscellaneous shop work. See how quickly it pays for itself, not once, but many times.

Write for Folder 50B which gives complete details.

Let us recapitulate the findings on

DUPLEX AIR AND MAGNETIC BRAKES

One of the features of BALANCED DESIGN

From the brake tests conducted by the Buffalo & Erie on July 17, 1926.

Tests were made on both double and single truck cars, first with normal rail and then with 1,075 ft. of both rails greased. Results for the double truck car weighing 37,500 lb. and with air pressure about 70 lb., showed an advantage for the Duplex Brakes of 192 feet and 714 feet respectively, in stopping from a speed of approximately 45 mph.

From further tests conducted by the Buffalo & Erie on July 20th.

Heads of both rails on a straight section of track coated with heavy car oil for 700 ft. Car speed 45 mph. Car stopped in 470 ft. with application of both air and magnetic brakes. Car went through 700 ft. oiled section and 85 ft. on dry track with air alone.

From results of our own tests—

"60 mph to stop in 800 feet on normal dry track."

BALANCED DESIGN resulted in the first practical application of this most modern braking system. It is typical of a modern car building program in which new speed, new comfort, new operating economy and new safety have been made the basis for car designs that are really NEW.

Let us talk it over with you.

"Perishable materials are sometimes utilized in the construction of track, in the effort to secure flexibility, and *the life of the track is shortened* to that of the perishable material"*

THIS simple idea is one of the fundamentals of Twin Tie construction. The combination of steel and concrete provides a uniform structure in which no part limits, by its shorter life, the life of the whole.

When steel, well proportioned, provides large bearing surfaces, tie members, and reinforcement for the concrete foundation of such construction, the life of the rail becomes the limiting factor in the life of your track.

Initial costs of twin tie construction are very low. Detailed figures from many jobs are available for comparison with your estimate and costs.—Write for them today.

*Quotation from a paper, "Modern City Track," read by Nelson R. Love, Chief Engineer of The Denver Tramway Corporation, at the Mid-West Electric Railway Association Meeting at Denver, July, 1926. We will be pleased to mail a copy of the complete article to those interested.

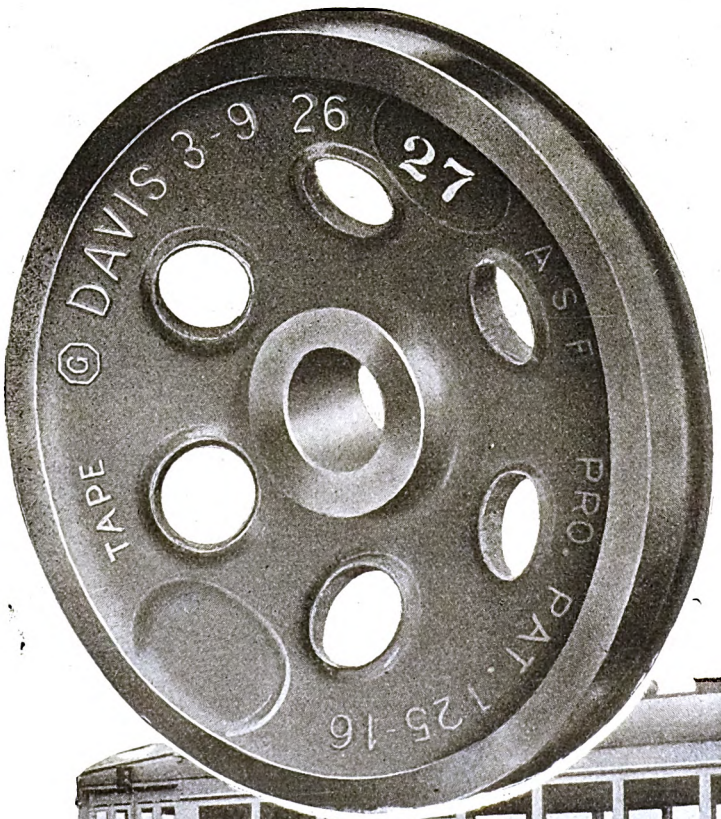
DAVIS "One-Wear" Steel Wheels

—longer life and greater mileage



Today, experienced buyers are specifying Davis "One-Wear" Steel Wheels for greater serviceability of equipment. Made from special steel, and heat-treated, the Davis "One-Wear" Steel Wheel is fundamentally strong.

The usual maintenance requirements and expense in keeping wheels in service is avoided. Throughout their longer life, they need no contour reconditioning.

Scientifically made so as to possess greatest strength, they resist the greater stresses of modern operation.

Freedom from flats and shell-outs is worth your investigation.

Why not have this longer life, greater mileage, and real economy.

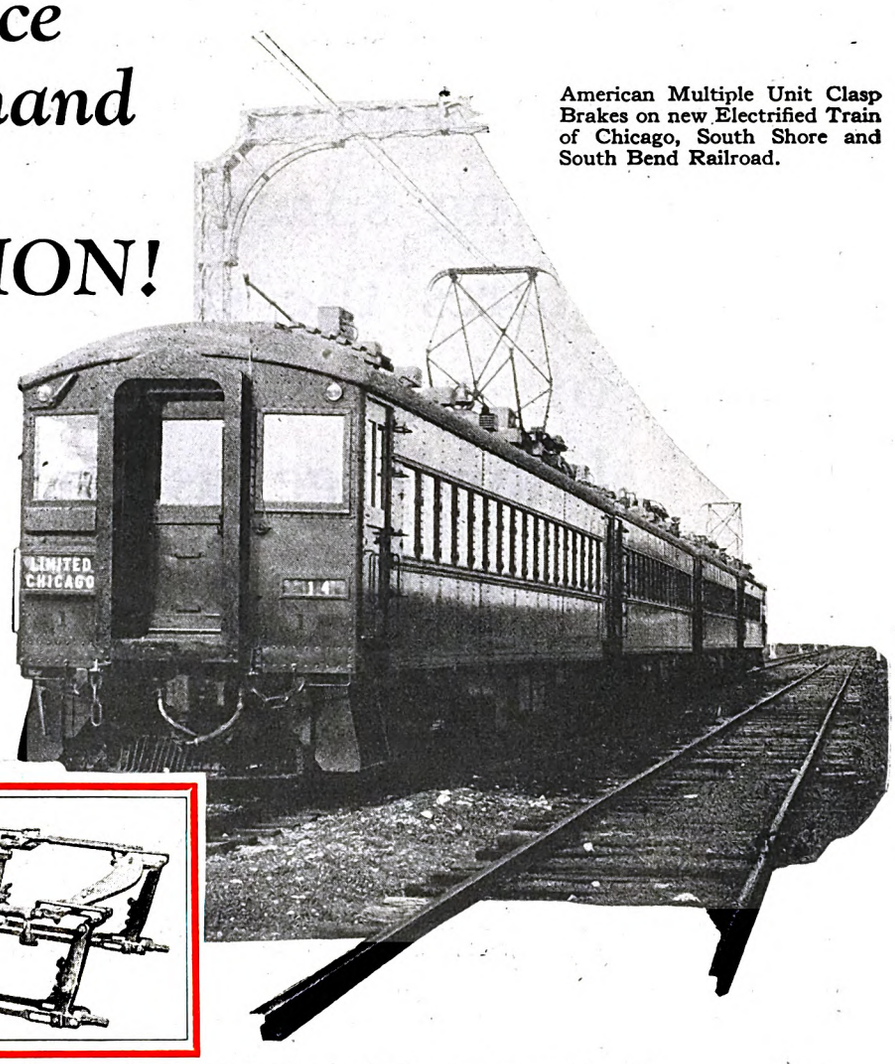
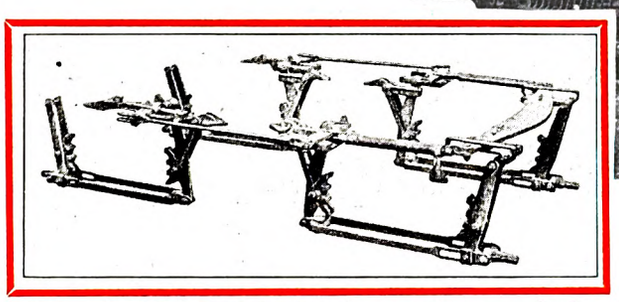
American Multiple Unit Clasp Brake

Speedier Service Schedules demand QUICK RETARDATION!



American Multiple Unit Clasp Brakes on new Electrified Train of Chicago, South Shore and South Bend Railroad.



Time is an important factor in modern suburban and street railway service. Obtaining higher rates of retardation is one way of gaining time and keeping faster schedules. It depends on your brakes.

American Multiple Unit Clasp Brakes balance the forces in the truck and double the friction area of the Brake Shoes.

American Multiple Unit Clasp Brakes are designed and manufactured on a sound engineering basis to produce short, smooth stops that modern service demands.

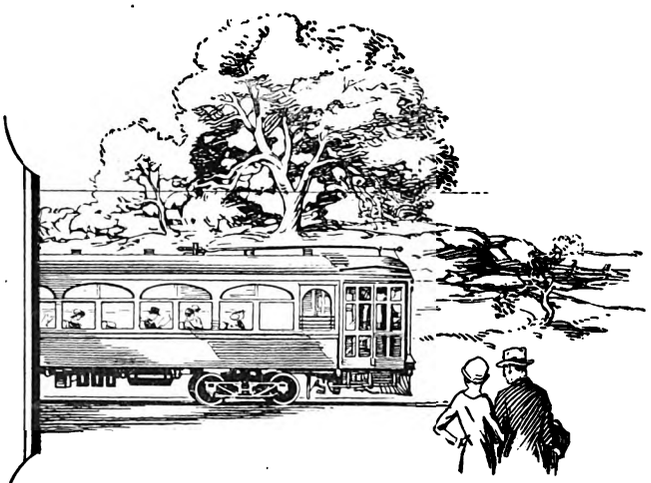
Of all the phases of modernization, increased schedule speed has the most far-reaching effect on earnings. It boosts your "production" per man-hour, and thereby reduces operating cost per car-mile. Most important of all, *it sells more service.*



Do modern cars increase schedule speed?

Here are reports from six roads. Each has improved its schedules during recent years. In each case modern cars were necessary. General Electric car equipment is used on every road.

"New equipment was necessary to maintain the increased schedule speeds in most cases."

LEVIS (P. Q.) TRAMWAYS CO.

"New light-weight cars, weight 32,000 pounds using GE-258 Motors, have been purchased and these accelerate much faster than the older, heavy type of car."

MORRIS COUNTY (N. J.) TRACTION CO.

"Schedule speeds increased by a gradual cut in running time; also through new equipment affording better acceleration."

NEW ORLEANS (LA.) PUBLIC SERVICE, INC.

"Schedule speeds slightly increased. By reducing stand time; also by the use of new equipment."

BIRMINGHAM (ALA.) ELECTRIC CO.

"Our schedule speed has been increased. Made possible by better track conditions; improvements in equipment such as light-weight all-steel construction and improvements in the motor design which give the car a faster acceleration and running speed; giving more attention to schedule maintenance and construction; a more thorough study of traffic conditions."

SAN ANTONIO (TEX.) PUBLIC SERVICE COMPANY

"Schedule speed increased from 8 miles to 9.2 miles an hour. This was accomplished by making a survey and finding every possible place where the speed could be increased, and also by using new equipment in the form of safety cars with a quick pick up and by eliminating all unnecessary lagging."

WISCONSIN POWER & LIGHT CO.

The resources and the service of the entire G-E organization are available to consider the problems of modernization and co-ordination—to find the most effective means of transportation and to build appropriate equipment.

330-19

GENERAL ELECTRIC

And on Modern Light-weight Combination City and Interurban Cars they specify—

PEACOCK STAFFLESS BRAKES!

Six new light-weight cars recently placed in both City and interurban service in Roanoke, Va., and vicinity, by the Roanoke Railway & Electric Company, are equipped with *Peacock Staffless Brakes!* Most modern cars are!

They have many advantages which especially adapt them to modern car design—improved appearance of platforms—light weight—minimum platform space occupation—chain winding capacity of 144 inches enabling them to develop maximum braking power under all conditions—and many others.

Write for facts and figures covering what they have done for others and what we know they will do for your cars.

"Freedom from Tire Failures en Route"

When you have a 280-mile bus run, such as Interstate Stages, Inc., of Detroit, has daily between Detroit and Chicago, you want tire equipment that provides utmost dependability en route.

Mr. E. A. Blake, President of Interstate Stages, Inc., writes that his line has found that equipment in Goodyear Balloon Bus Tires. Mr. Blake's letter reads as follows:

"We have received numerous unsolicited testimonials from people who have enjoyed the riding qualities of Goodyear Balloon Bus Tires, which are standard equipment on all our Fageol Safety Stages, operating daily between Detroit and Chicago, a distance of 280 miles.

"This type of tire has more than met our expectations and is giving wonderful service and freedom from tire failures en route.

"This, in conjunction with their sure-footedness on slippery roads, combined with our air brakes, has earned us the reputation of being the safest and most dependable motor transportation service between these two points."

* * *

You can always depend on Goodyear Tires for active, tractive, economical service on any road.

They are durable. They cushion. And they cost less per tire mile.

* * *

Made with SUPERTWIST, the extra-elastic, extra-enduring fabric developed by Goodyear for Goodyear Pneumatic Tires. Goodyears provide for any motorbus service the last word in bus tire value.

Only Goodyear Tires are made with SUPERTWIST—yet they cost you no more.

More people ride on Goodyear Tires than on any other kind

SALAAM

A doctor is highly honored in China.

Every coolie on meeting one salaams with both hands and sticks out his tongue.

The salaam symbolizes "How-do-you-do-sir."

And the tongue shows "I'm-pretty-well-thank-you."

Those of our readers who have Morganite brushes on their machines provide a similar greeting to the Morganite representative.

With a wave of the hand the operator directs him to the machines—

—and the gloss on the commutator (which is the tongue of the machine) signifies "Doing fine, thanks."

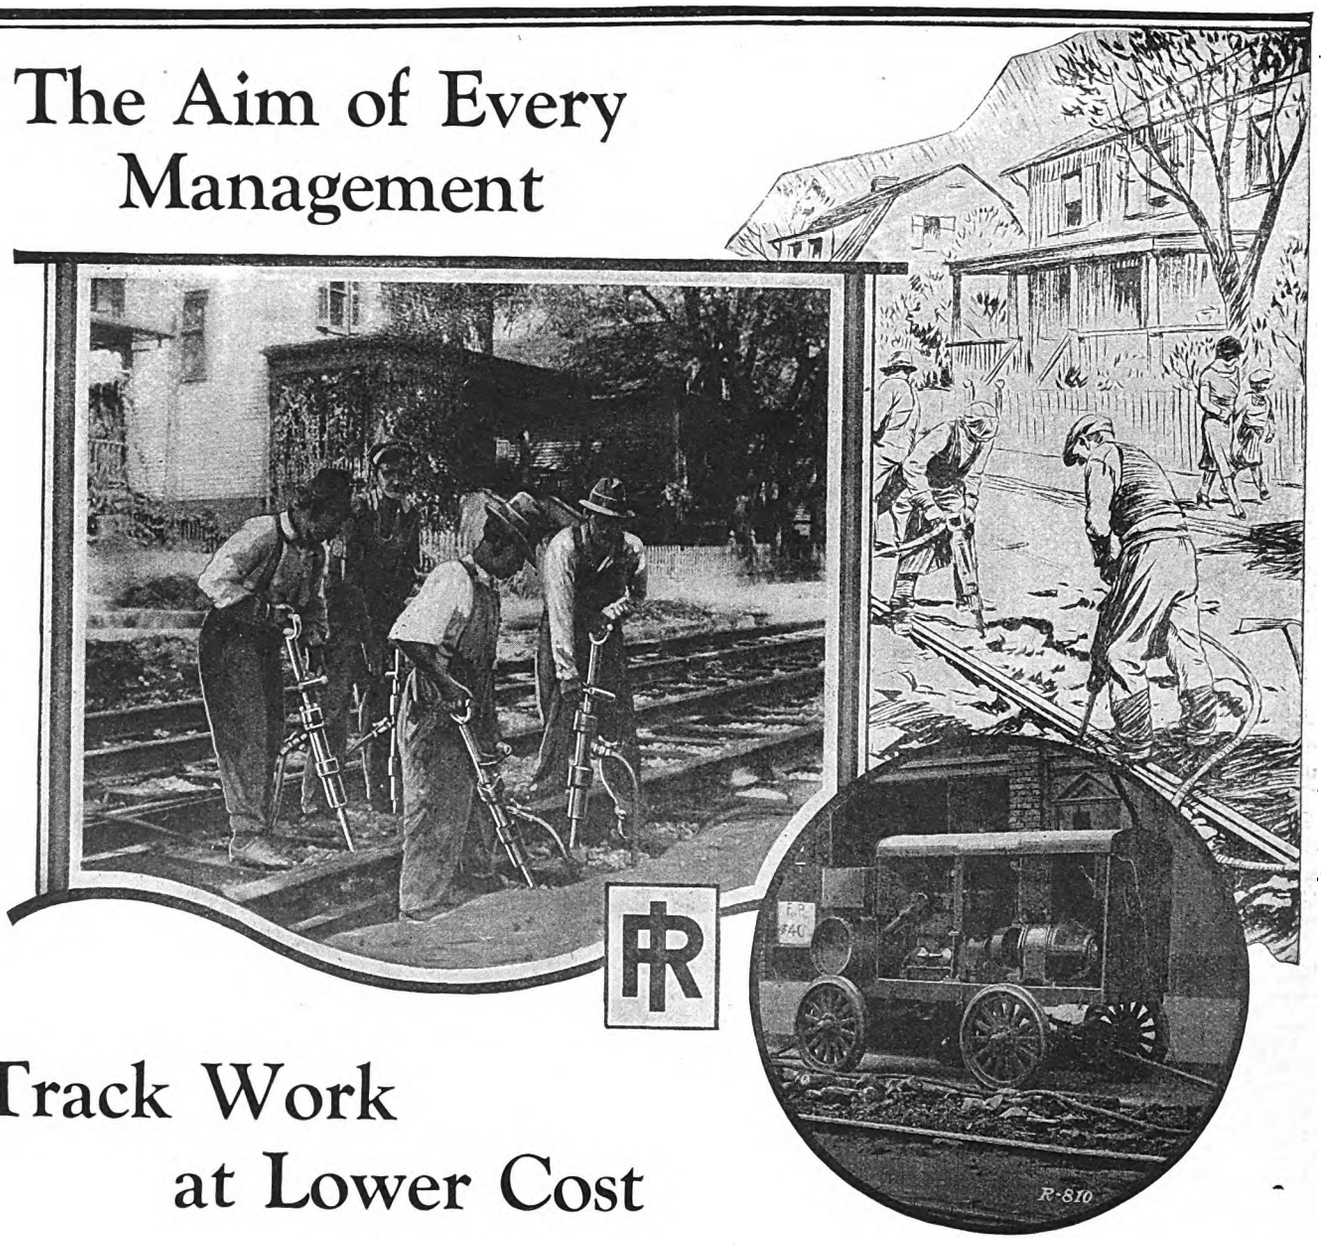
The Aim of Every Management



Track Work at Lower Cost

Ingersoll-Rand Pneumatic Paving Breakers and Tie Tampers prove an effective means for reducing the time and labor costs of maintenance and reconstruction operations.

Two men with CC-Paving Breakers will break out more concrete than twelve to sixteen men using hand methods. Four men with Pneumatic Tie Tampers will tamp more track, and do a better job, than a dozen men with hand picks and bars.

INGERSOLL-RAND COMPANY—11 BROADWAY, NEW YORK CITY.

Offices in principal cities the world over

A Single Segment or a Complete Commutator

is turned out with equal care in our shops. The orders we fill differ only in magnitude; small orders command our utmost care and skill just as do large orders. CAMERON quality applies to every coil or segment that we can make, as well as to every commutator we build. That's why so many electric railway men rely absolutely on our name.

By means of Westinghouse Supervisory Control the operator at the St. George substation of the Staten Island Rapid Transit Railway System controls the entire system. Under his control are four automatic railway substations, and two high-voltage power switching substations.

Above are shown the dispatcher's control desk at the St. George substation and the Clifton Junction substation relay cabinet.

1926

Trustworthy Apparatus

ONLY standard automatic telephone relays are used in Westinghouse Supervisory Control Systems. They are peculiarly adapted to the needs of supervisory control. Years of use on telephone lines have proved their dependability.

That the design of these relays is correct is shown by their operating records. A single unit has made, on test, more than 50,000,000 circuit closings without failure or any appreciable change in contact resistance.

In some large city telephone exchanges, after 15 years of continuous operation, the relay failures are only about 200 a year for 50,000,000 operations. In one large exchange the percentage of failures is but one in 5,000,000. The relays are given only an occasional inspection.

That is reliability.

And this is the kind of apparatus used in Westinghouse Supervisory Control Systems.

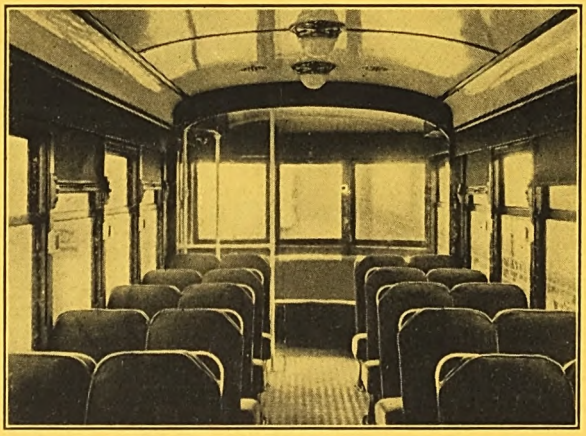
Thirty "1926" Safety Cars—

Another electric railway, with utmost confidence in its future, has just placed in service 30 new single-truck safety cars equipped in 1926 style and built by the American Car Company.

Plush upholstered Brill No. 105-B type non-reversible seats with divided backs, dome lights, control equipment and piping encased, and rubber tile floor covering, are included among the principal innovations. Numerous slogans are painted on the sides of the cars.



Attractively finished and equipped for comfort to stimulate car-riding

The measure of the added protection

Put it where convenient —it's self-contained

—and the accompanying curves plainly show the ideal character of protection which the G-E High-Speed Circuit Breaker provides. It protects synchronous converters, generators, motor-generators, rectifiers, motors, and feeders from overloads and short circuits. It can be installed to protect old or new machines without any change in their design or arrangement.

Backed by 9 years of experience —and by 900 in use

Bulletin 44742.1 describes the G-E High-Speed Breaker. Your G-E office has copies.

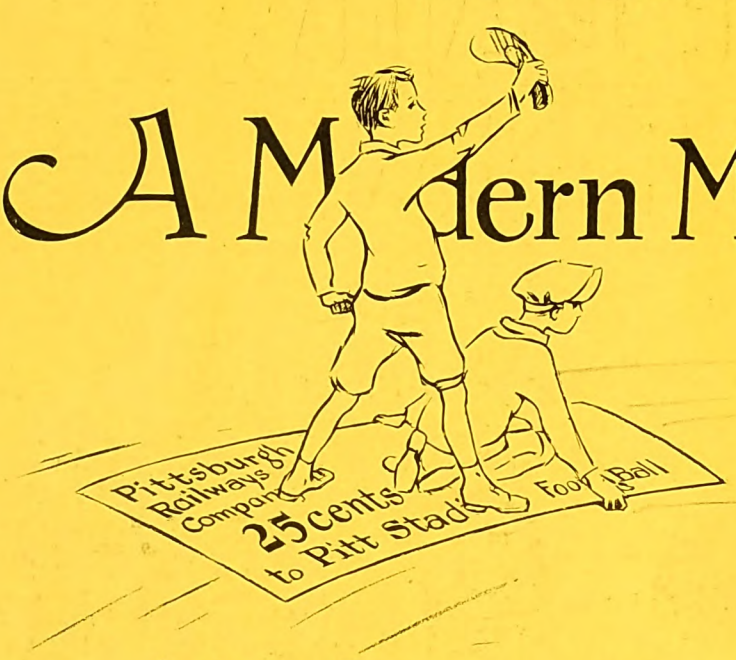
A Modern Magic Carpet



—brings Joy to thousands of boys, *and Street Railway Companies, too.*

THE Pittsburgh Railways Company, notable in the traction industry because of its efficient modernization program and its excellent service, has gained during the past season further popularity among its patrons and prospective patrons.

Cooperating with the University of Pittsburgh, Carnegie Institute of Technology and Pittsburgh's leading newspapers, the Pittsburgh Railways Company offered thousands of boys an opportunity to see major college football games at either of the city's large stadiums, in addition to round-trip transportation to and from home on passes—"*all for the price of a quarter*".

The inestimable good-will won by this action of the Pittsburgh Railways Company was manifested, not only by the youngsters themselves, but also by the parents. By this playtime offer, the company has assured for itself the friendship and support of not only potential car-riders, but,—looking forward—the car-riders of tomorrow.

An average of five thousand boys have been afforded the opportunity of seeing college football each week, the attendance increasing steadily, and consequently, during this afternoon period the off-peak curve has been nearly levelled out.

Wason-built light-weight cars for Milford & Uxbridge Street Railway

Light-weight Modern Cars

eliminate unnecessary expense

Excessively heavy cars are expensive to operate. With the introduction of new modern cars the railway company is relieved of its burden of moving unnecessary weight, and increased efficiency results. The Milford & Uxbridge Street Railway reduced its operating cost per car mile from 34.20 to 26.55 cents.

	Actual Operating Costs Per Car Mile	
	Old Cars	New Cars
Way and Structures	5.07	3.61
Maintenance of Equipment	3.09	3.25
Power	8.15	6.72
Conducting Transportation	14.92	10.40
Traffic	.....	.....
General and Misc.	2.97	2.57
Total	34.20	26.55

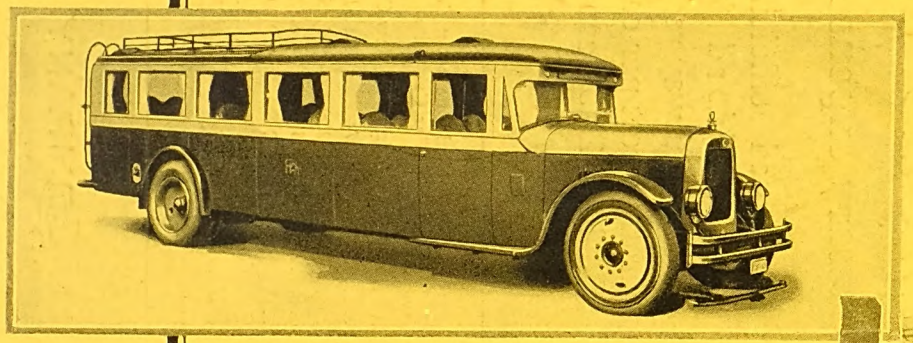
Not one pull-in with Gas-Electrics



33,225.7 miles in one day

. . . on the day of the great fight for the heavy-weight championship, we had in operation our entire motor bus fleet consisting of 362 buses, carrying approximately 150,000 passengers and did not have a single bus taken out of service for any reason. This includes not only our entire city operation, but also intercity buses which, as you know, operate from Philadelphia to Atlantic City, New York, Wilmington, Baltimore, Washington, and even over the Pennsylvania mountains to Niagara Falls, N. Y."

— FROM A LETTER WRITTEN BY MR. J. A. QUEENEY, VICE-PRESIDENT OF MITTEN MANAGEMENT, INC.

The Gas-Electric bus has no clutch or gear-shift transmission. The smooth and even flow of power makes possible more rapid acceleration, consequently higher schedule speeds. These are compelling factors in decreasing operating costs.

Philadelphia is not the only city which has tried the Gas-Electric bus and found it to be superior. There is an ever-increasing list of satisfied users.

General Electric has been building equipment for the transportation industry for more than thirty years. The G-E equipped Gas-Electric bus was designed to meet the urgent need for a more economical and more dependable rubber tired vehicle. The Gas-Electric buses of the Philadelphia Rural Transit Company—both city and intercity types—are daily demonstrating the many advantages of this design.
